

Air Quality Analysis for Fine Particulate Matter (PM_{2.5})

The following information comes from the ambient air monitors operated by the state. Data from these monitors is uploaded to the EPA's Air Quality System database, which constitutes the official record of air quality data. The monitoring information provided in the charts below highlights air pollutant levels (if any) that are in violation of the National Ambient Air Quality Standards.

PM_{2.5} is airborne particulate matter with an aerodynamic diameter smaller than 2.5 micrometers. It results from both direct emissions from air pollution sources (primary PM_{2.5}) and from atmospheric reactions between gaseous species that form particulate matter (secondary PM_{2.5}). Airborne particulate matter can have adverse effects on the respiratory system and also on the heart.

In December 2012, EPA made the annual primary PM_{2.5} standard more stringent, reducing it from 15 to 12 micrograms per cubic meter, based on the three-year average of annual means. The 24-hour primary PM_{2.5} standard was retained at 35 micrograms per cubic meter, based on the 98th percentile of 24-hour measurements, averaged over three years.

The St. Louis area is officially classified as a nonattainment area for the previous annual PM_{2.5} standard of 15 µg/m³ although area monitors currently are showing compliance with this standard and the department is working with EPA to redesignate the area as attainment. The entire state is classified as unclassifiable/attainment based on the 24-hour PM_{2.5} standard.

No monitors in Missouri that represent the appropriate area spatial scale of representativeness for comparison to the annual standard have recorded violations of the annual PM_{2.5} standard of 12 µg/m³. The state of Missouri recommended to EPA a designation of attainment of the 2012 standard for the St. Louis area. EPA designated the area unclassifiable.

For more information about PM_{2.5}, see the following EPA website, which includes links to additional information on health effects, standards, implementation, and other information:

^aQuality assured data through December 31, 2016.

^cYear-to-date preliminary data. Do not quote, do not cite.

^d98th Percentile concentration measured year-to-date. 98th Percentile concentrations may change as more data is collected over the year.

[^]The Blair Street and Ladue Site's PM_{2.5} design value is based on a combined site level statistic. That is, if a FEM sample is missing on a given day, a valid collocated FRM sample on that day will be substituted consistent with 40 CFR Part 50, Appendix N, 3.0 (d)(2).

[~]The Branch Street monitor is classified as a unique middle scale monitoring site and not comparable to the annual PM_{2.5} NAAQS.

*Near-Roadway site monitoring began on 1/1/2013.

**Near-Roadway site monitoring began on 7/1/2013.

***Monitor relocated from MSU and began monitoring on 4/16/2015.

†Monitoring discontinued on 4/15/2015.

***3-year design value can not be calculated. Design value in red and bold is a violation of the NAAQS.

CV - 35: The Critical Value (CV) for the 24-hour PM_{2.5} NAAQS is the current year's 98th percentile which, if monitored, could yield a violation of the 2006 24-Hour PM_{2.5} NAAQS for the most current three year period. (CV = 106.5 µg/m³ - Last year's 98th percentile - previous year's 98th percentile).

The highlighted field indicates that the data set does not meet the completeness criteria of 40 CFR Part 50 Appendix N, Section 4 for the given site. Use of incomplete data for designation purposes is subject to EPA approval consistent with 40 CFR Part 50 Appendix N, 4 .(d).
