

Residential Vapor Intrusion Sampling Quantities and TCE Exceedances

December 2015 - December 2016

Sample Location	Samples Collected and Analyzed	Initial Samples Exceeding Project-Specific Action Levels	Confirmation Samples Exceeding Project-Specific Action Levels
Indoor Air	116	3	1
Crawlspace	45	0	0
Subslab Soil Gas	108	3	1
Total No. of Samples	269	6	2
<i>Percentage of Total No. of Samples</i>		<i>2%</i>	<i><1%</i>

Notes:

Indoor Air = Air sample collected from the breathing zone inside residential structures.

Crawlspace = Air sample collected from the crawlspace beneath residential structures.

Subslab Soil Gas = Soil gas sample collected beneath residential structures.

Samples were analyzed for site-specific volatile organic compounds (VOCs).

Number of confirmation samples exceeding project-specific action levels is less than samples exceeding project-specific action levels because:

- 1) Exceedances were due to other VOC sources in the home, and/or
- 2) The confirmation sampling result was below the project-specific action level.
