RE: Trenton Farms Application

Dear Mr. Wieberg:

On August 3, 2016, I submitted a redacted version of Luke Minion's letter to the department dated July 13, 2016. Since submitting that redacted letter, Trenton Farms RE, LLC has decided to reduce the scope of the redactions. Accordingly, please find enclosed Mr. Minion's July 13 letter with fewer redactions than shown on the August 3 submission.

Sincerely,

By:

RE: In Re: Trenton Farms RE, LLC  
Application for a Class IC CAFO Missouri State Operating Permit

Dear Mr. Caldwell:

As you are aware, on August 12, 2015, the Department of Natural Resources issued to Trenton Farms RE, LLC ("Trenton Farms") a Missouri State Operating Permit for a Class IC CAFO. The permit was appealed by Hickory Neighbors United. The Administrative Hearing Commission recommended the MDNR's decision to issue the permit be upheld. However, on February 24, 2016, the Missouri Clean Water Commission reversed the MDNR's decision and denied the application for a Missouri State Operating Permit. Trenton Farms has appealed that decision. In the event the appeal is unsuccessful, Trenton Farms has decided to re-apply for the permit and provide more information concerning the two items that were the basis for the Missouri Clean Water Commission's decision to deny the permit. If Trenton Farms ultimately prevails in its appeal and the original permit is upheld, Trenton Farms will likely withdrawal the enclosed application for a Missouri state operating permit.

Protection From Inundation From 100 Year Flood

The enclosed application includes a Flood Plain Certification for Trenton Farms' property. Also enclosed are engineering drawings and an engineering certification from Todd Van Maanen certifying that the proposed building sites are protected from inundation from the 100 year flood as a result of the site design.

Continuing Authority

Missouri Clean Water Commission regulation 10 CSR 20-6.010(3)(A) requires applicants for new operating permits "show, as part of their application, that a permitted organization exists which will serve as the continuing authority for the operation, maintenance and modernization of the facility for which the application is made." The regulation requires that the applicant provide "proof to the department and the continuing authority has submitted a statement indicating acceptance of the facility." As required by this regulation, I enclose a Certificate of Good Standing from the Missouri Secretary of State's Office that shows that Trenton Farms RE, LLC is a Missouri limited liability company

that is in good standing. On behalf of Trenton Farms, I hereby make this statement indicating Trenton Farms' acceptance of the facility and pledge that Trenton Farms accepts responsibility to serve as the continuing authority for the operation, maintenance and modernization of the facility.

As stated in the Missouri Clean Water Commission's February 24, 2016, Final Decision, the Commission now interprets its continuing authority regulation to require "more than just a permanent organization." Unfortunately, the Final Decision provides no information or direction on what additional information is required in addition to proof that Trenton Farms is a permanent organization. Trenton Farms is aware of Leanne Tippett Mosby's May 26, 2016 memorandum to the Missouri Clean Water Commission. This memorandum says that the department will only request applicants to certify they are a permanent organization responsible for the operation, maintenance and modernization of the facility. It says the department would accept any supplementary information in support of this statement that the applicant may choose to submit. To date, we understand the Missouri Clean Water Commission has not responded to this memorandum and therefore, has apparently accepted the department's proposed course of action to implement the continuing authority regulation. Consequently, in light of the lack of clarity from the Clean Water Commission's Trenton Farms decision, Trenton Farms is relying upon Ms. Mosby's memorandum when it prepared the enclosed application for a Missouri state operating permit.

In an attempt to supplement my continuing authority certification statement made above, Trenton Farms explains below its corporate structure and its plans to finance and operate the Class IC CAFO. Trenton Farms understands this is the first time that any CAFO or industry has provided corporate and financial information to MDNR. This information is very sensitive and Trenton Farms requests it considered confidential business information (CBI).

- 1) Corporate Structure: Trenton Farms RE, LLC is a limited liability company organized in Missouri on March 25, 2015. According to its Articles of Organization, its duration is perpetual. The company is in good standing with the Missouri Secretary of State. PVC Management II, LLC is the sole member of Trenton Farms. PVC Management II, LLC is wholly owned by Pipestone Holdings, LLC, a Minnesota limited liability company. [REDACTED]

On or about October 19, 2015, PVC Management II, LLC adopted and approved the Trenton Farms' Operating Agreement. PVC Management II, LLC has not yet made a capital contribution to Trenton Farms. PVC Management II, LLC will make capital contributions as described below after it receives from the MDNR a final Missouri State Operating Permit and all legal challenges have been exhausted.

PVC Management II, LLC has designated me to be the corporate Manager of Trenton Farms. A separate employee will serve as the on-site farm manager. On March 25, 2015, I executed on behalf of Trenton Farms an *Assignment and Assumption Agreement* that assumed the rights to an option to purchase the property on which the Trenton Farms CAFO is proposed to be constructed.

- 2) Construction Costs: Pipestone has more than 25 years' experience designing and constructing modern livestock production facilities. Pipestone System has designed and constructed over 50 facilities. The projected construction cost of the Trenton Farms' facility is estimated to be approximately \$11 Million.
- 3) Funding of Construction. The Trenton Farms' construction costs will be funded through a combination of owner equity (contributed capital) and traditional debt financing (approximately 35% owner equity and 65% debt).

ii) Traditional debt will be secured from AgStar Financial for approximately \$7 Million. [RB1]

- 5) Insurance. Trenton Farms will carry comprehensive general liability insurance and pollution insurance.
    - a) Trenton Farms' comprehensive general liability insurance will include "replacement cost" for livestock and facility from Nationwide Insurance (A+ rated).
- 
- c) Trenton Farms will also have pollution insurance coverage in the unlikely event of a manure spill or release that causes damage.
- 6) Financial Statement. Projected Financial Statements for the Project (Balance Sheet & Income Statement) can be submitted if the MDNR and Clean Water Commission agree they will be kept confidential.
  - 7) Abandonment Commitment. At the time when Trenton Farms, or its successor or assigns, determines that the useful economic life of the facility has been depleted, it will undertake, at its cost, the removal, destruction and cleanup of the facility pursuant to applicable construction and demolition industry and engineering standards, as well as any applicable local, state and/or federal regulations. Nothing restricts or limits Trenton Farms' ability and right to maintain, fix, remodel, refurbish, reconstruct or otherwise improve the facility, assuming such activities are performed in compliance with all issued and/or effective permits, authorizations, laws, statutes, orders or regulations.
  - 8) Emergency Plan. Although not required by law, I also enclose an *Emergency Plan* to guide a response in the unlikely event the farm experiences a spill or other environmental mishap.

Jefferson City, MO 65102

RE: Trenton Farms RE, LLC, Grundy County, Missouri  
Project No. Y15118

Dear Mr. Caldwell:

We continue to strive to provide the best designs possible for our project. With that said we have reviewed the compost calculations and further defined the animal sizing and number breakdowns. I would ask that you utilize this set of documents dated July 13, 2016 in lieu those originally submitted dated May 9, 2016.

Find enclosed the design submittal information for the Trenton Farms RE, LLC Composting Facility. This information is being submitted to your office for the review and approval of the actively managed composting system to be utilized by the aforementioned facility. For your ease of review, these requirements have been paraphrased and answered in the following order.

- 1) Responsible Party for entire project: Trenton Farms RE, LLC, Luke Minion, 1300 S HWY 75, PO Box 188, Pipestone, MN 56164  
- Legal Description: SW 1/4, Section 19, T60N, R24W, Grundy County, Missouri  
- Site Information: The Swine Production Operation includes 6,376 head breeding swine (which includes 960 head of development gilts in the GDU unit) and associated piglets, plus 360 head of nurse piglets in the GDU unit. The compost facility will be located northwest portion of the swine site. Enclosed is a Site Map of the Trenton Farms RE, LLC Composting facility.
- 2) Site Preparation: The composter should be built on an impervious weight-bearing pad that is large enough to allow equipment to maneuver, covered with a roof to prevent excessive moisture on composting

material and built of rot resistant material that is strong enough to with stand the force exerted by equipment. Included are a Site Layout Map of the facility and the Compost Building Details.

- 3) Type of Carcass: Swine
  
- 4) Disposition of Finished Compost: The finished compost will be primarily be recycled back into the as a starter bulking agent or utilized for land application in conjunction with their Missouri Department of Natural Resources approved Nutrient Management Plan.
  
- 5) Estimated Quantity: The average daily death loss is calculated at 616 pounds per day, which can also be translated as total death loss per year at 224,840 pounds. Please refer to the Compost Bin Sizing Spreadsheet that illustrates this data. *Note the formula has determined that 7 bins are required, but as a safety factor 9 bins will be constructed.*
  
- 6) Type of Composting Materials: The bulking agents that will be utilized are locally available wood chips and/or sawdust. At times shredded cornstalks will be introduced into the mixture at no greater than a 50/50 blend. Compost material generated from the operation shall also be utilized in the bulking mixture as a start agent. An estimated 833 cubic yards (341,424 pounds, assuming sawdust bulk density) of bulking material will be required annually. Please refer to the Compost Bin Sizing Spreadsheet for this data.
  
- 7) Actively Managed Composting Procedure: *\*Note that the University of Missouri Extension's current published composting procedure is for static pile system. The actively managed composting procedure was taken from Composting Animal Mortalities, Minnesota Department of Agriculture, May 2009. The procedure, computations and the composter building design were completed with the consultation of the University of Missouri's Extension Service.*
  - Place at least 12 inches of bulking agent on the floor of the composting bin. This layer will insulate the composting material from the outside environment, provide carbon to fuel the composting process, and absorb liquids.
  - Place the carcasses in a single layer on top of the bulking agent one foot from the wall of the bin and at least six inches apart. This allows air to

circulate around the carcasses and insulates them from the environment. Depending on the size of the bin and of the loader, one may not want to build a whole single layer first, because the loader may not be able to reach the back of the bin when more carcasses are added later. This can be avoided by building the pile from the back, building it up and forward simultaneously.

- Cover the carcasses with about 12 inches of bulking agent. Add water as needed to maintain the proper moisture level. Because it is difficult to add water evenly, consider adding it to the bulking agent before it goes on the pile. Caution: If the pile dries out (25% to 45% moisture) and if piles are too large, spontaneous combustion can occur, just as with hay or silage. Attention to moisture, temperature, and pile size is the best protection. An accessible water supply is a good safety precaution. If manure will be used, add it either beneath the bulking agent or incorporated with the bulking agent. The pile is now ready for the next layer.
- Record the species, class, and weight of the carcasses, and the amount and type of bulking agent and into the compost log.
- Place additional carcasses as they become available on the pile in layers following these same steps, allowing 6 to 12 inches of bulking agent between layers. More than one species can be composted in the same bin (if applicable). It may be necessary to use the loader bucket to dig a depression to hold the fresh carcass in place before covering it with bulking agent, especially if it is a large animal. Continue adding carcasses until the pile is close to the top of the bin. Cover the top of the pile with 12 inches of bulking agent to reduce odor and protect against pests. SD Animal Industry Board regulations require that flies, rodents, and vermin be controlled so as not to be a health hazard to human or animal populations.
- After the bin is full, start a second bin following these same steps. Leave the first bin to compost. This first bin has carcasses at various stages of decomposition from largely decomposed (first one in) to just beginning (last one in).
- Monitor the pile daily to make sure that all carcass parts stay completely covered by bulking agent. The pile will settle, so you may need to add additional bulking agent over the top.
- Check the temperature daily and record it in the compost log. The temperature should be taken at multiple locations in the pile, especially near the last animal that was added. Temperatures should be increasing and should soon be between 130° and 150° F.
- If it seems that the pile is not composting correctly because of the temperature or because there are odors, some troubleshooting will need to be done and make adjustments accordingly.
- Once the pile reaches at least 130°F, it should stay above that temperature for at least one week. Do not start counting the days until the area that was

added to the pile last reaches this temperature. When the temperature drops, the pile is ready to be turned.

- The typical primary composting time is approximately 45 days for carcasses weighing from 25 to 300 lbs. See the table of estimates for primary composting times by carcass weight.

<b>Primary Composting Times</b>	
	<i>Estimated</i>
<i>Primary Carcass Size (lb)</i>	<i>Composting Days</i>
0-10	15
10-25	22
25-300	45

8) Plan for Turning the Pile and Finishing the Compost: *\*As taken from Composting Animal Mortalities, Minnesota Department of Agriculture, May 2009.*

- Layer the bottom of an empty bin with 12 inches of bulking agent.
- Use a front-end or skid loader to move the material from the primary bin to the secondary bin, one bucket at a time. This aerates the pile. Minimal flesh or soft bones should be present, but long bones, skulls, teeth, and pelvis, and some hide, feathers, and fleece may remain. There may be some odor while turning due to disturbance of the anaerobic zones. Look to see whether water needs to be added. If so, add it to the existing pile as needed before or while it is being turned, so that it gets evenly incorporated.
- Cover the fresh pile with another 12 inches of bulking agent to prevent odor and visits by scavenging animals.
- Record the date turned and bulking agent type and volume used in the compost log.
- Monitor and record the temperature of the turned pile daily. Since the composting materials are more consistent now, one doesn't need to be as careful about taking the temperature in multiple locations.
- Once the pile maintains a temperature in excess of 130° F for seven days and then drops, the compost may be finished.
- Secondary composting times will be similar to the number of days in the primary cycle.

- Inspect the pile. If flesh is no longer visible, the compost can be termed “finished.” It should be dark, humus-like material with very little odor. At this stage, any bones should be so brittle that they can be easily crushed. It is required that the finished product contain no visible pieces of soft tissue. If there is still some flesh visible, you need to turn the pile again and let it go through another heat cycle. With larger animals such as cattle and sheep, more time is needed to completely compost their larger and denser bones. If the compost is finished other than the bones, remove them and place in a new pile for further decomposition.
- 9) Plan for Monitoring Temperature: A probe-type thermometer with a minimum 36-inch stainless steel stem will be used to monitor the temperature of the pile.
  - 10) Plan for Moisture Testing and Monitoring: For optimum performance, the moisture content should be between 40% and 60%. Proper moisture judgment can be made by simply feeling the compost. The compost should be moist and leave the hand feeling moist, but should not be able to squeeze water out of it. A water hydrant or other water source will be installed next to the composting facility in the event that water needs to be added to the compost.
  - 11) Plan for Monitoring and Inspection for Complete Decomposition Prior to Distribution: The finished product should be a dark, humus-like material with minimal odor. Any bones should be brittle and easily crushed. If the compost is finished other than the bones, they shall be removed and placed in a new pile for further decomposition. The finished compost should not contain any visible pieces of soft tissue. If soft tissue is present, the pile should be turned and allowed to go through another heat cycle.
  - 12) Frequency of Activities: A logbook will be kept to record dates and weights of carcasses placed in the composter, temperature readings, moisture content, amounts of bulking agents used, dates when compost is turned and dates and amounts of finished compost.
  - 13) Seasonal or Year Round: Year Round
  - 14) Distance from Natural Surface Water, Wells, and Property Lines:
    - Natural Surface water: An unnamed tributary of Hickory Creek is approximately 1,400 feet south of the proposed location of the compost building.
    - Well: The compost building will be located at least 300 feet from any on site wells.
  - 15) Records for Review Upon Request: Records for review will be available upon request at the swine operation main office.

This facility is taking the necessary steps to protect the environment and continue to provide needed livestock production in Grundy County and the State of Missouri.

We welcome your favorable review of the information. If you have any questions or need any additional information, please do not hesitate to contact us. Thank you.

Sincerely,  
**Stockwell Engineers, Inc.**

County: **Grundy County, MO**  
Location: **Section 19, T60N, R24W**

E/A Project No. 15118

Date: 13-Jul-16

### Daily Mortalities

Carcass Size (lb)	Multiplier for Death Loss*	Loss per Day (lb)
0-10	3 ft <sup>3</sup> /day	161
10-25	5 ft <sup>3</sup> /day	0
25-300	10 ft <sup>3</sup> /day	9
300-750	14 ft <sup>3</sup> /day	446
750-1400	20 ft <sup>3</sup> /day	0

**Total Death Loss per Day:** 616 lbs

**Primary bin volume required:** 6817 ft<sup>3</sup>

\*Information taken from Minnesota Department of Agriculture, *Composting Animal Mortalities*, pg. 19

### Bins Required

Bin Sizes	Height	<b>8 ft</b>
	Width	<b>15 ft</b>
	Depth	<b>24 ft</b>

**Number of Bins Required\*\*** 7 Bins Required

\*\*Assuming equal number of primary and secondary bins, plus one storage bin

### Composting Material Required

Total Death Loss per Day (lb)	<b>616 lb</b>
Total Death Loss per Year (lb)	<b>224,840 lb</b>

**Total Composting Material Required\*\*\*** 833 yd<sup>3</sup>/yr  
341,424 lb/yr

\*\*\*Assuming 100 ft<sup>3</sup> of sawdust of equivalent compost material per 1,000 lb of mortality & 410 lb/yd<sup>3</sup> of sawdust

## Emergency Response Plan

Farm Name: <u>TRENTON FARMS RE, LLC</u>		
Owner/Operator: <u>TRENTON FARMS RE, LLC</u>	Phone: <u>TBD</u>	Cell: <u>TBD</u>
Owner/Operator: _____	Phone: _____	Cell: _____
Farm Address: <u>TBD (911)</u>		
Farm Location: T <u>60</u> N, R <u>24</u> E <input checked="" type="radio"/> W Section <u>19</u> County: <u>Grundy</u>		
Driving Directions or Emergency Coordinates: <u>Southwest of the intersection of PINE LANE and Highway W. Lat 39.99573, Lon -93.64725</u>		

### In Case of Injury, Fire, or Rescue Emergency, Immediately Implement the Following:

1. Assess the condition of the victim, extent of the emergency (fire, rescue) and call for help.
2. Stabilize the victim, use on-site rescue equipment, evacuate buildings, or begin fire suppression as necessary.
3. Brief emergency responders upon arrival on current status of situation.

### In Case of a Spill, Leak, or Failure at the Storage Facility, During Transport, or Land Application, Immediately Implement the Following:

1. Stop the source of the leak or spill. For example:
  - Turn off all pumps/valves and clamp hoses or park tractor on hoses to stop the flow of manure.
2. Assess the situation and make appropriate calls for people, equipment, and materials. See contacts below.
  - Notify DNR spill hotline: \_\_\_\_\_ (Spill reporting is mandatory by state law.)
  - Call sheriff's office if spilled on public roads or its right-of-ways for traffic control.
  - Clear the road and roadside of spilled material immediately.
3. Contain the spill and prevent spillage from entering surface waters, tile intakes, or waterways.
  - Use a skid loader or tractor with a blade to build dikes to contain or divert the spill or leak.
  - Insert sleeves around tile intakes (or plug/cap intakes) and block down slope culverts.
  - Use tillage implements to work up the ground ahead of the spill or use absorptive materials.
4. Begin cleanup.
  - Use pumps to recover liquids.
  - Land apply on approved cropland at appropriate rates.
5. Document your actions.

#### Be prepared to provide the following information:

- Your name and contact information
- Farm address, location and other pertinent identification information.
- Nature of emergency (employee injury, fire, discharge of manure or hazardous materials).
- Emergency equipment and personnel that are needed.
- Potential for manure or hazardous materials to reach surface waters or major field drains.
- Current status of containment efforts.
- Location of hazardous/flammable materials, fire suppression equipment, emergency cut off switches or valves.

# Contact Names and Numbers

A list of contact names and numbers should be filed with the emergency action plan and a copy posted by the phone for emergencies.

## Site Name

## Manure Spill Emergency Response Plan

### What to do in Case of a Manure Spill

1. **Eliminate the source.**
  - Stop manure application or pumps.
  - Close valves.
  - Separate pipes, creating an air gap and stopping flow.
  - Transfer manure/liquid to another basin or lagoon.
  
2. **Contain the spill, if possible.**
  - Create a containment dam in the field, ditch or stream.
  - In a field, use tillage equipment to slow the flow
  - Check for tile flows.
  - Construct a temporary holding basin down slope.
  - Ensure that you do not damage the embankment while creating a temporary basis.
  - If possible, place soil over the point of seepage, ensuring that you do not drive over or compact the seepage point.
  
3. **Assess the extent of the spill and note any obvious damages.**
  - Did the spill reach any surface waters, well casings or other sensitive areas?
  - How much was released?
  - What time?
  - Did any damage occur (employee injury, fish kills, or property damage)?
  - Can the spill reach streams?
  
4. **Contact the appropriate agencies.**
  
5. **Clean up the spill and make repairs.**
  
6. **Prepare and submit summary.**

July 13, 2016

Dear Landowners,

I am writing you on behalf of our client Trenton Farms RE, LLC who has hired Pinnacle to help prepare a permit application that has been submitted to the Missouri Department of Natural Resources. Trenton Farms RE, LLC would like to inform you of its intentions to build and operate a sow complex in Grundy County.

The site will consist of three buildings, all of which will have below building manure storage pits. The site's total capacity will be approximately 6,056 sows, 320 nursery pigs and 960 swine over 55 pounds. These animals will be housed in three barns located on about 20.5 acres adjacent to State Highway W. A site map is enclosed showing the approximate location of the barns. Trenton Farms RE, LLC will have a nutrient management plan filed with the Missouri Department of Natural Resources. Nutrients from the pits below the barns will be land applied on approximately 914 acres of crop land, pasture and hay ground in Grundy County at an application rate based on a manure sample pulled from the pits yearly, and the nutrient uptake of the crops.

If you have any questions or comments contact the Water Protection Program at the Missouri Department of Natural Resources. The Department of Natural Resources will accept comments 30 days from the date of this letter. The Department of Natural Resources contact information is:

Water Protection Program  
Missouri Department of Natural Resources  
1101 Riverside Drive  
P.O. Box 176  
Jefferson City, MO 65102-0176  
(573) 751-1300

The site will be located in the Southwest Quarter of Section 19, Township 60-N, Range 24-W, Grundy County, Missouri.

The CAFO site owner's contact information is:

Trenton Farms RE, LLC  
1300 S. Hwy 75

## **TRENTON FARMS RE, LLC PROJECT SUMMARY**

Trenton Farms RE, LLC, proposes to construct three hog confinement buildings in Grundy County, Section 19, Township 60 North Range 24 West. The site will consist of a gestation barn housing 4480 sows, a farrowing barn housing 936 sows and a Gilt Development Unit for 960 swine over 55 pounds and 320 nursery pigs. A composter will also be built on site. The site will have an animal unit capacity of 2282.4, making it a Class 1C Confined Animal Feeding Operation.

Manure will be stored in formed concrete structures below the Gestation Barn and GDU. Manure from the Farrowing Barn will drain into the Gestation Barn

Total storage capacity for the Gestation Barn will be 7,074,162 gallons, in excess of the Gestation Barn and Farrowing Barn's combined estimated annual manure production of 3,687,147 gallons. The GDU Barn will have 781,295 gallons of storage capacity, in excess of its estimated annual manure production of 530,368 gallons. The entire facility, therefore, has projected storage capacity in excess of 365 days.

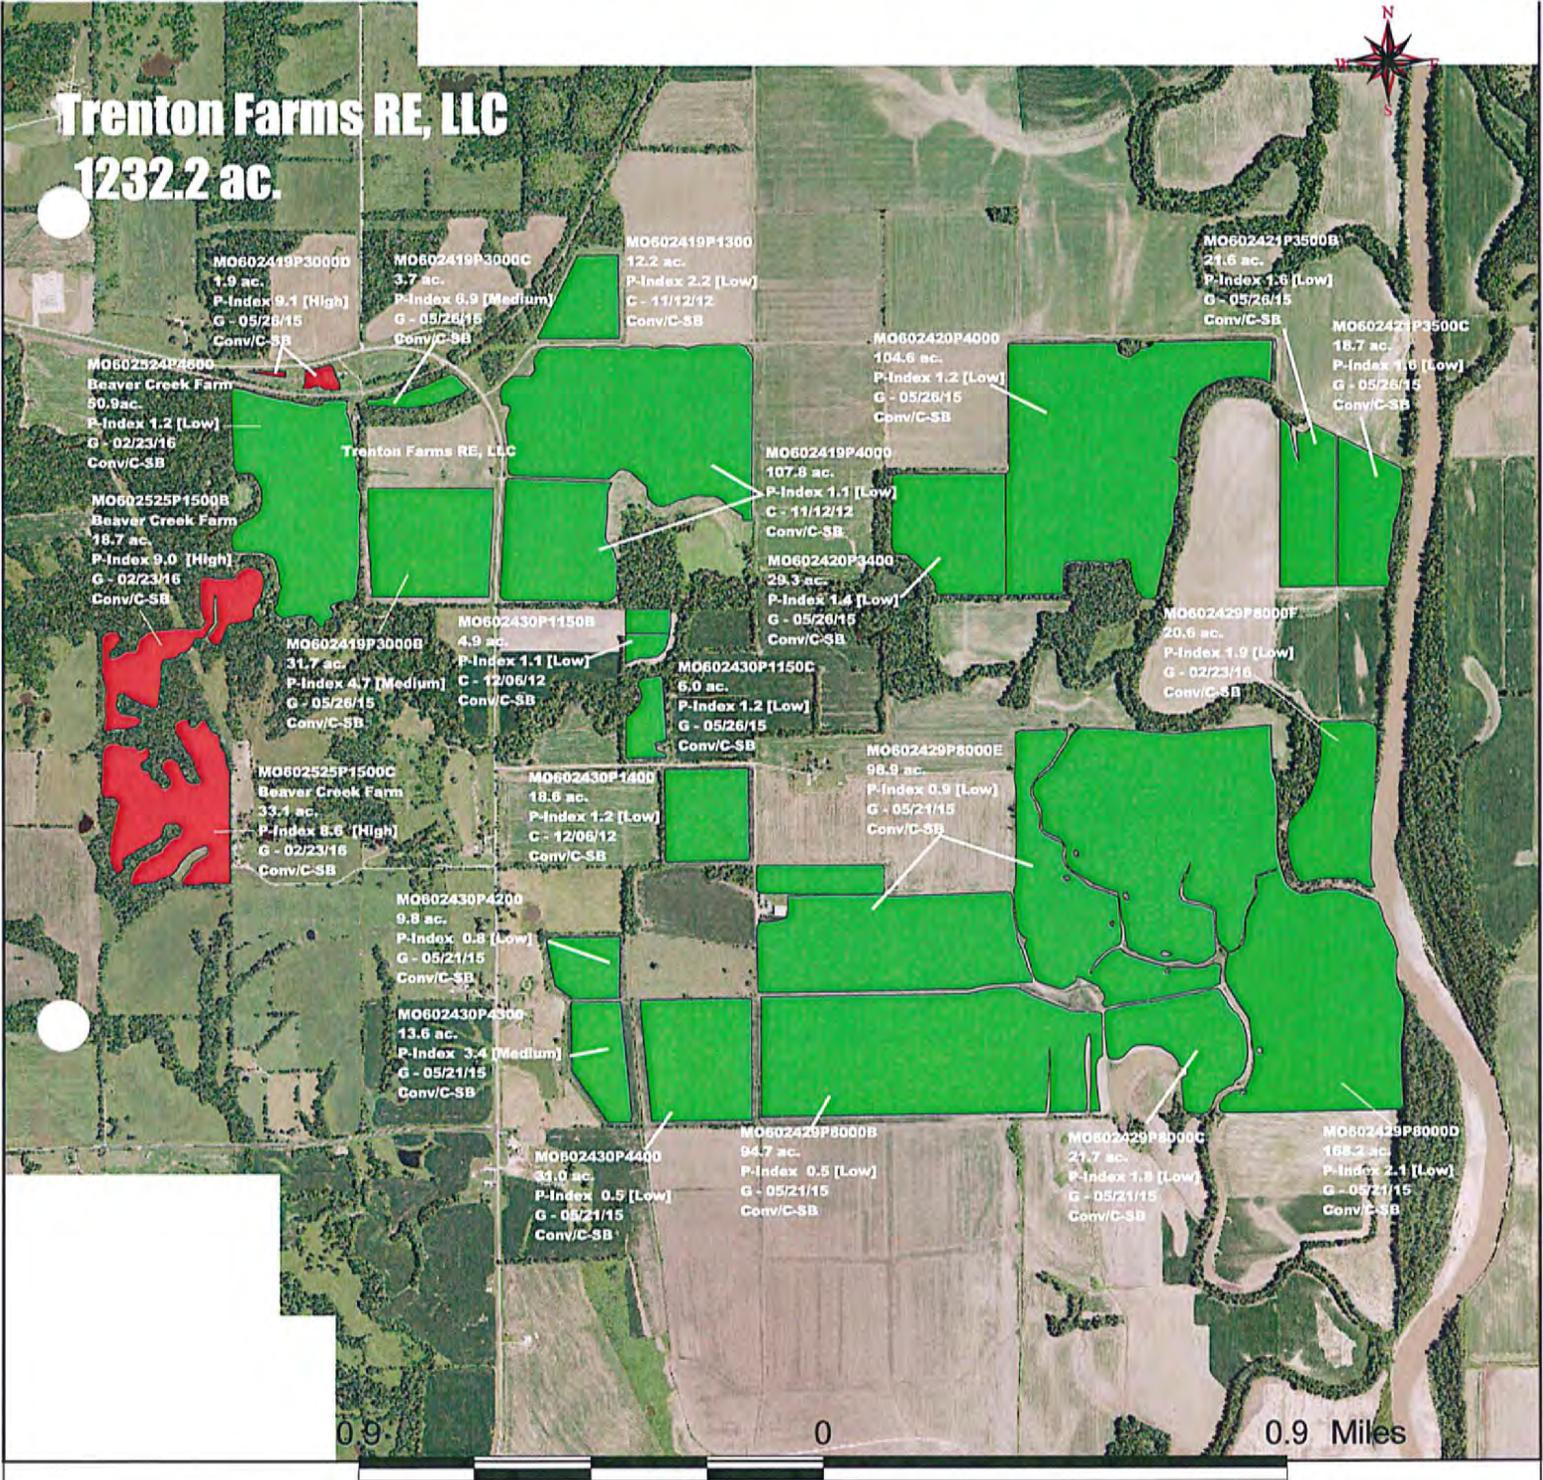

Manure from Trenton Farms RE, LLC will be applied to fields listed in the site's Nutrient Management Plan at agronomic rates based on the crop uptake of nutrients and the nutrient analysis of the manure. Manure will be injected, not surface applied. Manure will be tested annually for nutrient content. Mortalities will be composted within 24 hours of death and stored under roof until the compost material can be land applied.

Fields listed in the nutrient management plan for land application of manure will be soil sampled every five years, using protocols prescribed by the Missouri Concentrated Animal Feeding Operation Nutrient Management Technical Standard. The soil samples will be analyzed by a certified laboratory and the results included in any nutrient management plan updates.

Enclosed is a nutrient management plan prepared by The Pinnacle Group on behalf of Trenton Farms RE, LLC.

# Missouri Comprehensive Nutrient Management Plan FARMER PLAN DOCUMENT

**Operation Name: Trenton Farms RE, LLC**

This plan is a summary of the key activities for one year of the nutrient management plan. The period of time covered by this plan is:  
**8/2017 - 7/2018**

The objective of this document is to provide a concise list of the nutrient management activities on this operation for the year indicated. Activities covered by this plan include:

- Planned manure transfers and sales.
- Planned manure application dates and rates.
- Planned fertilizer application dates and rates.

Record keeping is an important part of nutrient management. Please use the space in this plan to record what actually occurred on each field.

**Farm contact information:** Trenton Farms RE, LLC  
SW State Highway W  
Trenton, MO 64683  
507-825-7032 (office)

**Whole Plan Period:** August 2017 - July 2022

**C. Planned Commercial Fertilizer Applications - 8/2017 - 7/2018**

No planned commercial fertilizer applications for the period.

### D. Recommended Manure Management Practices

Every time you apply manure you should review the following checklist to be sure conditions are favorable for manure applications. **These practices are required on permitted operations and operations that receive cost-share support through EQIP.**

- Know the proper manure source and application rate for each field.
- Keep good records, write down such things as operations performed, dates and times, actual rates, and weather conditions. This document provides record keeping forms.
- No surface application of manure if precipitation, likely to create runoff, is forecasted to occur within 24 hours of the planned application.
- No manure application on land with a slope greater than 20 percent.
- No surface application of manure to frozen, snow-covered or saturated soils.
- Manure applications shall comply with all manure application setbacks defined in the table below:

Manure application setback distances where manure should not be applied. For streams, lakes and wetlands the setback distance is measured from the defined edge of the water feature.

Setback Feature	Application Conditions	Setback Distance (feet)
Public or private drinking water well, drinking water lake or impoundment, or drinking water intake structure.	All applications	300
Other wells including un-plugged abandon wells	All applications	300
Public and privately owned lakes and impoundments not used as a water supply including impoundments with no outlet. Perennial streams, intermittent streams, canals, drainage ditches and wetlands. Tile line inlet (un-plugged during application).	Permanently vegetated setback	35
	Up-gradient, no or insufficient vegetated setback	100
	Down-gradient, no or insufficient vegetated setback	35
Losing streams, cave entrance, spring, or active sinkhole.	All applications	300
Non-owned occupied residence.	All applications	150
Public use area including non-owned businesses.	All applications	150
Public roads and property boundaries.	All applications	50

**The following practices are recommended:**

- Apply nutrients close to crop use to maximize nutrient uptake and reduce potential losses.
- Calibrate and maintain application equipment to apply accurate and uniform rates; all land application equipment should be calibrated at least annually.
- Avoid application when wind is blowing in the direction of neighbors or on weekends and holidays when people are more likely to be outdoors.

**For liquid applications:**

- Adjusting surface application rates to meet infiltration rate and water holding capacity of the soil.
- Irrigation systems should have automatic shut-off devices in case of pressure loss and/or an operator on-site at all times during operation to monitor application equipment.
- The perimeter of all fields receiving manure should be checked regularly during operation of land application equipment to confirm manure is not running off the field or entering waters of the state.

<sup>1</sup>These lime recommendations assume you used the University of Missouri soil testing laboratory, or comparable lab.

<sup>2</sup>NA = Neutralizable Acidity, units in meq/100g soil.

<sup>3</sup>ENM = Effective Neutralizing Material.

<sup>4</sup>EMg = Effective Magnesium.

\*\* - No recommendation: No crop has been selected for this field in order to calculate lime recommendation.

\* - No recommendation: Some soil test data is missing for this field. Please run the Essential Data Detection Tool.

[D] To determine limestone needed in tons/acre, divide your ENM requirement by the guarantee of your limestone dealer.

I. Crop Record Keeping Table: 8/2017 - 7/2018

# Missouri Comprehensive Nutrient Management Plan FARMER PLAN DOCUMENT

**Operation Name: Trenton Farms RE, LLC**

This plan is a summary of the key activities for one year of the nutrient management plan. The period of time covered by this plan is:  
**8/2018 - 7/2019**

The objective of this document is to provide a concise list of the nutrient management activities on this operation for the year indicated. Activities covered by this plan include:

- Planned manure transfers and sales.
- Planned manure application dates and rates.
- Planned fertilizer application dates and rates.

Record keeping is an important part of nutrient management. Please use the space in this plan to record what actually occurred on each field.

**Farm contact information:** Trenton Farms RE, LLC  
SW State Highway W  
Trenton, MO 64683  
507-825-7032 (office)

**Whole Plan Period:** August 2017 - July 2022

# Contents

Manure Transfers ( Table A ) .....	3
Planned Manure Applications ( Table B ) .....	4
Manure Application Records .....	6
Planned Commercial Fertilizer Applications ( Table C ) .....	7
Commercial Fertilizer Application Records .....	8
Recommended Manure Management Practices ( Table D ) .....	9
Field by Field Recommendations ( Table E ) .....	10
Summary ( Tables F and G ) .....	45
- Manure Summary	
- Land Applied Nutrient Summary	
Lime Recommendations ( Table H ) .....	46
Crop Record Keeping ( Table I ) .....	48

**A. Manure Transfers - 8/2018 - 7/2019**

*Exports off the Farm: (blank rows are for recording exports as they occur)*

Export Month	Export Year	Source of Manure	Target Export Amount	Units	Receiving Operation	Notes

*Imports onto the Farm: (blank rows are for recording imports as they occur)*

Import Month	Import Year	Source of Manure	Animal Type	Target Import Amount	Units	Notes

*Internal Transfers of Manure: (blank rows are for recording transfers as they occur)*

Transfer Month	Transfer Year	Source of Manure	Manure Destination	Target Transfer Amount	Units	Notes

**B. Planned Manure Applications - 8/2018 - 7/2019**

Month and Year	Field ID	Field SubID	Planned Crop(s)	Source	Application Equipment	Acres Covered	Application Rate	Units per acre	Total Applied
Oct 2018	MO602420P 4000		Corn grain	GDU	Applicator	104.6	3,400	Gal	355,640

**C. Planned Commercial Fertilizer Applications - 8/2018 - 7/2019**

No planned commercial fertilizer applications for the period.

**D. Recommended Manure Management Practices**

Every time you apply manure you should review the following checklist to be sure conditions are favorable for manure applications. **These practices are required on permitted operations and operations that receive cost-share support through EQIP.**

- Know the proper manure source and application rate for each field.
- Keep good records, write down such things as operations performed, dates and times, actual rates, and weather conditions. This document provides record keeping forms.
- No surface application of manure if precipitation, likely to create runoff, is forecasted to occur within 24 hours of the planned application.
- No manure application on land with a slope greater than 20 percent.
- No surface application of manure to frozen, snow-covered or saturated soils.
- Manure applications shall comply with all manure application setbacks defined in the table below:

Manure application setback distances where manure should not be applied. For streams, lakes and wetlands the setback distance is measured from the defined edge of the water feature.

Setback Feature	Application Conditions	Setback Distance (feet)
Public or private drinking water well, drinking water lake or impoundment, or drinking water intake structure.	All applications	300
Other wells including un-plugged abandon wells	All applications	300
Public and privately owned lakes and impoundments not used as a water supply including impoundments with no outlet. Perennial streams, intermittent streams, canals, drainage ditches and wetlands. Tile line inlet (un-plugged during application).	Permanently vegetated setback	35
	Up-gradient, no or insufficient vegetated setback	100
	Down-gradient, no or insufficient vegetated setback	35
Losing streams, cave entrance, spring, or active sinkhole.	All applications	300
Non-owned occupied residence.	All applications	150
Public use area including non-owned businesses.	All applications	150
Public roads and property boundaries.	All applications	50

**The following practices are recommended:**

- Apply nutrients close to crop use to maximize nutrient uptake and reduce potential losses.
- Calibrate and maintain application equipment to apply accurate and uniform rates; all land application equipment should be calibrated at least annually.
- Avoid application when wind is blowing in the direction of neighbors or on weekends and holidays when people are more likely to be outdoors.

**For liquid applications:**

- Adjusting surface application rates to meet infiltration rate and water holding capacity of the soil.
- Irrigation systems should have automatic shut-off devices in case of pressure loss and/or an operator on-site at all times during operation to monitor application equipment.
- The perimeter of all fields receiving manure should be checked regularly during operation of land application equipment to confirm manure is not running off the field or entering waters of the state.

**8/2018 - 7/2019 NUTRIENT MANAGEMENT PLAN**

**FIELD ID: MO602419P1300**

<sup>1</sup>These lime recommendations assume you used the University of Missouri soil testing laboratory, or comparable lab.

<sup>2</sup>NA = Neutralizable Acidity, units in meq/100g soil.

<sup>3</sup>ENM = Effective Neutralizing Material.

<sup>4</sup>EMg = Effective Magnesium.

\*\* - No recommendation: No crop has been selected for this field in order to calculate lime recommendation.

\* - No recommendation: Some soil test data is missing for this field. Please run the Essential Data Detection Tool.

[D] To determine limestone needed in tons/acre, divide your ENM requirement by the guarantee of your limestone dealer.

## Comprehensive Nutrient Management Plan

### FARMER PLAN DOCUMENT

**Operation Name: Trenton Farms RE, LLC**

This plan is a summary of the key activities for one year of the nutrient management plan. The period of time covered by this plan is:  
**8/2019 - 7/2020**

The objective of this document is to provide a concise list of the nutrient management activities on this operation for the year indicated. Activities covered by this plan include:

- Planned manure transfers and sales.
- Planned manure application dates and rates.
- Planned fertilizer application dates and rates.

Record keeping is an important part of nutrient management. Please use the space in this plan to record what actually occurred on each field.

**Farm contact information:** Trenton Farms RE, LLC  
SW State Highway W  
Trenton, MO 64683  
507-825-7032 (office)

**Whole Plan Period:** August 2017 - July 2022

# Contents

**C. Planned Commercial Fertilizer Applications - 8/2019 - 7/2020**

No planned commercial fertilizer applications for the period.

**D. Recommended Manure Management Practices**

Every time you apply manure you should review the following checklist to be sure conditions are favorable for manure applications. **These practices are required on permitted operations and operations that receive cost-share support through EQIP.**

- Know the proper manure source and application rate for each field.
- Keep good records, write down such things as operations performed, dates and times, actual rates, and weather conditions. This document provides record keeping forms.
- No surface application of manure if precipitation, likely to create runoff, is forecasted to occur within 24 hours of the planned application.
- No manure application on land with a slope greater than 20 percent.
- No surface application of manure to frozen, snow-covered or saturated soils.
- Manure applications shall comply with all manure application setbacks defined in the table below:

Manure application setback distances where manure should not be applied. For streams, lakes and wetlands the setback distance is measured from the defined edge of the water feature.

Setback Feature	Application Conditions	Setback Distance (feet)
Public or private drinking water well, drinking water lake or impoundment, or drinking water intake structure.	All applications	300
Other wells including un-plugged abandon wells	All applications	300
Public and privately owned lakes and impoundments not used as a water supply including impoundments with no outlet. Perennial streams, intermittent streams, canals, drainage ditches and wetlands. Tile line inlet (un-plugged during application).	Permanently vegetated setback	35
	Up-gradient, no or insufficient vegetated setback	100
	Down-gradient, no or insufficient vegetated setback	35
Losing streams, cave entrance, spring, or active sinkhole.	All applications	300
Non-owned occupied residence.	All applications	150
Public use area including non-owned businesses.	All applications	150
Public roads and property boundaries.	All applications	50

**The following practices are recommended:**

- Apply nutrients close to crop use to maximize nutrient uptake and reduce potential losses.
- Calibrate and maintain application equipment to apply accurate and uniform rates; all land application equipment should be calibrated at least annually.
- Avoid application when wind is blowing in the direction of neighbors or on weekends and holidays when people are more likely to be outdoors.

**For liquid applications:**

- Adjusting surface application rates to meet infiltration rate and water holding capacity of the soil.
- Irrigation systems should have automatic shut-off devices in case of pressure loss and/or an operator on-site at all times during operation to monitor application equipment.
- The perimeter of all fields receiving manure should be checked regularly during operation of land application equipment to confirm manure is not running off the field or entering waters of the state.

**8/2019 - 7/2020 NUTRIENT MANAGEMENT PLAN**

**FIELD ID: MO602419P1300**

**Field Information**

Total Acres:	14.4	Spreadable Acres:	12.2
Non-Spreadable Acres:	2.2	Distance to Storage:	0.00 miles

<sup>1</sup>These lime recommendations assume you used the University of Missouri soil testing laboratory, or comparable lab.

<sup>2</sup>NA = Neutralizable Acidity, units in meq/100g soil.

<sup>3</sup>ENM = Effective Neutralizing Material.

<sup>4</sup>EMg = Effective Magnesium.

\*\* - No recommendation: No crop has been selected for this field in order to calculate lime recommendation.

\* - No recommendation: Some soil test data is missing for this field. Please run the Essential Data Detection Tool.

[D] To determine limestone needed in tons/acre, divide your ENM requirement by the guarantee of your limestone dealer.

# Missouri Comprehensive Nutrient Management Plan FARMER PLAN DOCUMENT

**Operation Name: Trenton Farms RE, LLC**

This plan is a summary of the key activities for one year of the nutrient management plan. The period of time covered by this plan is:

8/2020 - 7/2021

The objective of this document is to provide a concise list of the nutrient management activities on this operation for the year indicated. Activities covered by this plan include:

- Planned manure transfers and sales.
- Planned manure application dates and rates.
- Planned fertilizer application dates and rates.

Record keeping is an important part of nutrient management. Please use the space in this plan to record what actually occurred on each field.

**Farm contact information:** Trenton Farms RE, LLC  
SW State Highway W  
Trenton, MO 64683  
507-825-7032 (office)

**Whole Plan Period:** August 2017 - July 2022

6. Weather condition at time of application: Sunny, Partly Cloudy, Cloudy, Rain, Snow.

**C. Planned Commercial Fertilizer Applications - 8/2020 - 7/2021**

No planned commercial fertilizer applications for the period.

**D. Recommended Manure Management Practices**

Every time you apply manure you should review the following checklist to be sure conditions are favorable for manure applications. **These practices are required on permitted operations and operations that receive cost-share support through EQIP.**

- Know the proper manure source and application rate for each field.
- Keep good records, write down such things as operations performed, dates and times, actual rates, and weather conditions. This document provides record keeping forms.
- No surface application of manure if precipitation, likely to create runoff, is forecasted to occur within 24 hours of the planned application.
- No manure application on land with a slope greater than 20 percent.
- No surface application of manure to frozen, snow-covered or saturated soils.
- Manure applications shall comply with all manure application setbacks defined in the table below:

Manure application setback distances where manure should not be applied. For streams, lakes and wetlands the setback distance is measured from the defined edge of the water feature.

Setback Feature	Application Conditions	Setback Distance (feet)
Public or private drinking water well, drinking water lake or impoundment, or drinking water intake structure.	All applications	300
Other wells including un-plugged abandon wells	All applications	300
Public and privately owned lakes and impoundments not used as a water supply including impoundments with no outlet. Perennial streams, intermittent streams, canals, drainage ditches and wetlands. Tile line inlet (un-plugged during application).	Permanently vegetated setback	35
	Up-gradient, no or insufficient vegetated setback	100
	Down-gradient, no or insufficient vegetated setback	35
Losing streams, cave entrance, spring, or active sinkhole.	All applications	300
Non-owned occupied residence.	All applications	150
Public use area including non-owned businesses.	All applications	150
Public roads and property boundaries.	All applications	50

**The following practices are recommended:**

- Apply nutrients close to crop use to maximize nutrient uptake and reduce potential losses.
- Calibrate and maintain application equipment to apply accurate and uniform rates; all land application equipment should be calibrated at least annually.
- Avoid application when wind is blowing in the direction of neighbors or on weekends and holidays when people are more likely to be outdoors.

**For liquid applications:**

- Adjusting surface application rates to meet infiltration rate and water holding capacity of the soil.
- Irrigation systems should have automatic shut-off devices in case of pressure loss and/or an operator on-site at all times during operation to monitor application equipment.
- The perimeter of all fields receiving manure should be checked regularly during operation of land application equipment to confirm manure is not running off the field or entering waters of the state.

8/2020 - 7/2021 NUTRIENT MANAGEMENT PLAN

<sup>1</sup>These lime recommendations assume you used the University of Missouri soil testing laboratory, or comparable lab.

<sup>2</sup>NA = Neutralizable Acidity, units in meq/100g soil.

<sup>3</sup>ENM = Effective Neutralizing Material.

<sup>4</sup>EMg = Effective Magnesium.

\*\* - No recommendation: No crop has been selected for this field in order to calculate lime recommendation.

\* - No recommendation: Some soil test data is missing for this field. Please run the Essential Data Detection Tool.

[D] To determine limestone needed in tons/acre, divide your ENM requirement by the guarantee of your limestone dealer.

# Missouri Comprehensive Nutrient Management Plan FARMER PLAN DOCUMENT

**Operation Name: Trenton Farms RE, LLC**

This plan is a summary of the key activities for one year of the nutrient management plan. The period of time covered by this plan is:

8/2021 - 7/2022

The objective of this document is to provide a concise list of the nutrient management activities on this operation for the year indicated. Activities covered by this plan include:

- Planned manure transfers and sales.
- Planned manure application dates and rates.
- Planned fertilizer application dates and rates.

Record keeping is an important part of nutrient management. Please use the space in this plan to record what actually occurred on each field.

**Farm contact information:** Trenton Farms RE, LLC  
SW State Highway W  
Trenton, MO 64683  
507-825-7032 (office)

**Whole Plan Period:** August 2017 - July 2022

# Contents

**C. Planned Commercial Fertilizer Applications - 8/2021 - 7/2022**

No planned commercial fertilizer applications for the period.

**D. Recommended Manure Management Practices**

Every time you apply manure you should review the following checklist to be sure conditions are favorable for manure applications. **These practices are required on permitted operations and operations that receive cost-share support through EQIP.**

- Know the proper manure source and application rate for each field.
- Keep good records, write down such things as operations performed, dates and times, actual rates, and weather conditions. This document provides record keeping forms.
- No surface application of manure if precipitation, likely to create runoff, is forecasted to occur within 24 hours of the planned application.
- No manure application on land with a slope greater than 20 percent.
- No surface application of manure to frozen, snow-covered or saturated soils.
- Manure applications shall comply with all manure application setbacks defined in the table below:

Manure application setback distances where manure should not be applied. For streams, lakes and wetlands the setback distance is measured from the defined edge of the water feature.

Setback Feature	Application Conditions	Setback Distance (feet)
Public or private drinking water well, drinking water lake or impoundment, or drinking water intake structure.	All applications	300
Other wells including un-plugged abandon wells	All applications	300
Public and privately owned lakes and impoundments not used as a water supply including impoundments with no outlet. Perennial streams, intermittent streams, canals, drainage ditches and wetlands. Tile line inlet (un-plugged during application).	Permanently vegetated setback	35
	Up-gradient, no or insufficient vegetated setback	100
	Down-gradient, no or insufficient vegetated setback	35
Losing streams, cave entrance, spring, or active sinkhole.	All applications	300
Non-owned occupied residence.	All applications	150
Public use area including non-owned businesses.	All applications	150
Public roads and property boundaries.	All applications	50

**The following practices are recommended:**

- Apply nutrients close to crop use to maximize nutrient uptake and reduce potential losses.
- Calibrate and maintain application equipment to apply accurate and uniform rates; all land application equipment should be calibrated at least annually.
- Avoid application when wind is blowing in the direction of neighbors or on weekends and holidays when people are more likely to be outdoors.

**For liquid applications:**

- Adjusting surface application rates to meet infiltration rate and water holding capacity of the soil.
- Irrigation systems should have automatic shut-off devices in case of pressure loss and/or an operator on-site at all times during operation to monitor application equipment.
- The perimeter of all fields receiving manure should be checked regularly during operation of land application equipment to confirm manure is not running off the field or entering waters of the state.

8/2021 - 7/2022 NUTRIENT MANAGEMENT PLAN

<sup>1</sup>These lime recommendations assume you used the University of Missouri soil testing laboratory, or comparable lab.

<sup>2</sup>NA = Neutralizable Acidity, units in meq/100g soil.

<sup>3</sup>ENM = Effective Neutralizing Material.

<sup>4</sup>EMg = Effective Magnesium.

\*\* - No recommendation: No crop has been selected for this field in order to calculate lime recommendation.

\* - No recommendation: Some soil test data is missing for this field. Please run the Essential Data Detection Tool.

[D] To determine limestone needed in tons/acre, divide your ENM requirement by the guarantee of your limestone dealer.

# Manure Management Plan Form

## Determining Maximum Allowable Manure Application Rate

**Instructions:** Complete a worksheet for each unique combination of the following factors (crop rotation, optimum crop yield, manure nutrient concentration, remaining crop N need, method of application) that occurs at this operation. Complete form by filling in blanks, yellow-colored cells, and drop down menus. Gray shaded cells will calculate automatically. Footnotes are given on pages 4, 5 and 6.

### Management Identification (Mgt ID)<sup>i</sup>

Compost material N-Based

*(identify this application scenario by letter)*

Method to determine optimum crop yield<sup>f</sup>

Timing of application

Method of application

Application loss factor

If spray irrigation is used, identify method<sup>l</sup>

# Composting Dead Swine

Charles D. Fulhage  
Department of Agricultural Engineering

Charles E. Ellis  
Extension Agricultural Engineering Specialist, Troy, Mo.

The Missouri Dead Animal Law requires that a dead animal carcass be properly disposed of within 24 hours. In Missouri there are five acceptable methods of carcass disposal. They are: rendering, composting, landfilling, incineration and burial. This publication discusses composting as a means of complying with the dead animal law for swine operations. For information on the other methods, refer to MU publication *WQ216, Dead Animal Disposal Laws in Missouri*.

## Composter location

The composter should be located away from areas of sensitive water quality such as streams, ponds and wells. A location at or near the crest of a hill will eliminate or minimize the amount of surface water approaching the composter from higher areas. If a composter must be located in the lower part of a slope, a diversion terrace should be constructed around the upper side of the composter to keep surface water out.

When locating a composter, consider the farm residence and any nearby neighbor residences that might be affected. While offensive odors are not generated if the composting process is properly managed, the handling of dead swine and compost on a daily basis may not be aesthetically pleasing. Also, consider traffic patterns required in moving dead swine to the composter, moving the required ingredients to the composter and removing finished compost from the composter. The composter site should be well-drained and provide all-weather capability for access roads and work areas.

## Composting ingredients and recipe

Composting dead swine requires the addition of a carbon source to ensure proper carbon/nitrogen ratios are present for the composting process. Experience thus far suggests that sawdust an ideal carbon source due to its small particle size, ease of handling, absorbency and high carbon content. Experience using straw as the only carbon source has been less successful, with lower composting temperatures, leaching of fluids from the composting pile and longer composting times required. When sawdust is used as a carbon source, plan to provide about 100 cubic feet of sawdust per 1,000 pounds of carcass to be composted. For farrow-to-finish operations, sawdust requirements are about one-third to one-half cubic yards per sow in the herd on an annual basis. See Table 1 for a summary of compost criteria.

**Table 1**  
Summary of swine composting design and management criteria

- **Sawdust requirements**

One half cubic yard of sawdust per sow in the herd for farrow-to-finish operations (annually) or 100 cubic feet (about 4 cubic yards) of sawdust per 1,000 pound carcass composted.

- **Nitrogen addition**

Up to 3 pounds ammonium nitrate per 100 pounds swine carcass as needed, mix with sawdust.

- **Water addition**

If sawdust is dry, add water to obtain a damp feel and appearance, up to 1 to 1-1/2 gallons per cubic foot of sawdust.

- **Composter size**

20 cubic feet of primary and secondary bin volume per pound of carcass composted daily. Size bins for floor area of 100 to 200 square feet, and depth of 5 to 6 feet.

- **Temperature**

130 to 160 degrees Fahrenheit indicates active composting.

- **Time**

Compost three months in primary bins, and an additional three months in secondary bins.

A precise carbon/nitrogen ratio does not seem to be necessary to obtain good composting, and most composting with sawdust as the carbon source has been done without adding supplemental nitrogen. However, if sawdust is used according to the above recommendations, some supplemental nitrogen would have to be added to obtain the ideal carbon/nitrogen ratio of 25. The addition of about 3 pounds of ammonium nitrate ( $\text{NH}_4\text{NO}_3$ ) in the dry, granular form per 100 pounds of swine carcass will provide the nitrogen necessary to achieve a carbon nitrogen ratio of about 25. The ammonium nitrate should be mixed with the sawdust used to cover the carcass and can be applied by simply "hand-scattering" as carcasses are covered with sawdust. As noted previously, most composting is accomplished without the use of additional nitrogen, but this practice may help in starting up new composting operations and obtaining the desired composting temperatures.

The type of sawdust used in composting can influence the success of the operation. Although a fine or small particle size sawdust is not necessary, wood chips and shavings do not seem to work well due to their larger particle size. Sawdust or wood refuse material derived from bark and/or mulching operations may contain rocks, stones and other foreign material as well as excessively large wood particles, and should not be used for composting.

Most sawdust in Missouri is obtained from sawmills, lumbering and logging operations or cabinet making and furniture making businesses. Such sawdust is generally quite adequate for composting. The moisture content and bulk density of sawdust are important factors in composting. Bulk density is important in estimating the amount of sawdust to use; moisture content, which also affects bulk density, should be in the proper range for composting. Tests on fresh sawdust obtained from seasoned logs or kiln-dried lumber indicate a bulk density of 16 to 20 pounds per cubic foot with a moisture content of 20 to 30 percent. Sawdust stored in a pile tends to gain moisture content. Tests on aged sawdust (more than 5 years old) showed moisture content in the 50 to 70 percent range and bulk density of about 30 pounds per cubic foot. Most of the increase in bulk density is due to the increase in moisture content.

The ideal moisture content in a composting pile is 50 to 60 percent. Swine carcasses have a moisture content near this range, and much sawdust obtained from outside piles may also be near this range. Hence it may not be necessary to adjust moisture content or add water in the composting recipe. However, if the sawdust is exceptionally dry or the composting pile becomes dry due to the internal heat generated, it may be necessary to add water for optimum composting.

The moisture content of sawdust or a composting mixture can be judged somewhat by its appearance and feel. Sawdust that has a damp appearance and feel is probably near the proper moisture content for composting. If it appears wet, or free water can be squeezed out, it should be allowed to dry to a damp

condition before being used. Fresh sawdust taken immediately from sawing kiln-dried lumber or seasoned logs will probably be too dry and water will have to be added. Add water as needed to obtain a damp feel and appearance in the sawdust. Very dry sawdust (20 percent moisture) may require the addition of 1 to 1-1/2 gallons of water per cubic foot of sawdust to obtain the proper moisture content. Water should be mixed with the sawdust by sprinkling or spraying as the sawdust is placed on the carcasses. Avoid the over-addition of water, as excessively wet mixtures do not compost properly and may require removal and mixing with dry sawdust to recover the process. "Green" sawdust from fresh-cut, unseasoned logs may have a moisture content as high as 80 percent. Green sawdust may be too wet for optimum composting, and should be allowed to dry somewhat or should be mixed with drier sawdust or finished compost before using. A water line and hydrant installed at the composter will facilitate water addition and general cleanup activities.

Temperature is the best indicator that the composting process is proceeding properly. Temperatures in the composting pile should rise to the 130 to 160 degrees Fahrenheit range, indicating active microbial activity and breakdown of the carcasses.

## Composter design

The composting process requires the proper ingredients to be placed in composting bins in the correct proportions, allowed to compost for a period of time, then moved to a second bin for a secondary composting phase. A minimum of three months composting time is needed in both the primary and secondary phases. It may be necessary to extend this period of time if an unusual number of large carcasses are composted, or if ambient temperatures are low enough to slow the composting process.

In most cases a minimum of three bins will be required, two of which are used for primary composting and the third for secondary composting. In the typical scenario, Bin 1 is filled with three months' death loss, at which time Bin 2 is started. At the end of the second three-month period, Bin 2 is full, and the last carcasses placed in Bin 1 have composted for three months. The contents of Bin 1 are then ready to move to Bin 3 for the secondary composting phase.

After three months of secondary composting, the material can be moved out and applied to land, and the secondary bin is available to receive the contents of Bin 2. Larger operations will require more than the minimum three bins; experience has shown that having extra bins available for storage of fresh sawdust and finished compost is beneficial.

Total bin area and volume requirements depend upon the size of operation and death loss incurred. Actual past death loss data should be used in sizing composters for existing operations. For planning purposes and sizing composters for new operations, see the average death loss data in Table 2. A minimum of 20 cubic feet of volume is needed in both primary and secondary bins per pound of carcass composted daily. Bins are typically filled to a depth of 5 to 6 feet for composting. While bin configuration is not critical, bins are usually laid out as three-sided enclosures. The open side should be wide enough (at least two feet wider than bucket width) so that the bin contents are easily accessible with a front end or skid-steer loader. Square bins offer the greatest opportunity for reduced side effects, (heat loss through walls), although length:width ratios of up to 2:1 are acceptable. Primary and secondary bins should be located close or adjacent to each other (perhaps with a common wall) to facilitate moving compost from bin-to-bin. Excessively large bins should be avoided. Experience has shown that bins with 100 to 200 square feet of surface area work well. See Table 1 for a summary of composter design criteria.

**Table 2**  
Average annual death loss for swine in confinement

	Weight range (pounds)	Average weight (pounds)	Annual death loss (percent)	Annual death loss per animal space (pounds)
Sow herd <sup>1</sup>	350 to 400	375	6 to 8	21 to 32
Nursery <sup>2</sup>	13 to 50	32	22 to 26	3 to 13
Finishing	50 to 250	150	10 to 12	5 to 30

<sup>1</sup>Includes all mature animals, farrowing, gestating, and boars.

<sup>2</sup>Includes losses in farrowing house prior to weaning.

#### Note

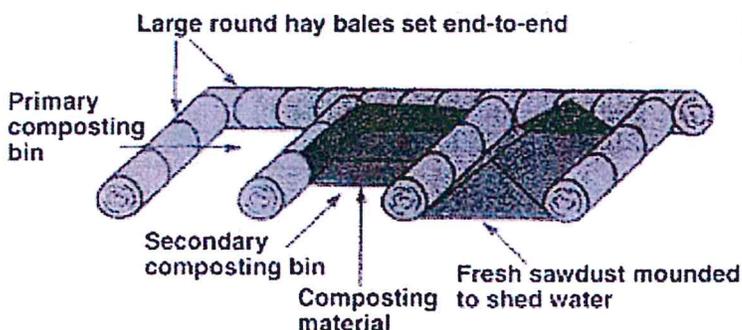

Death losses can vary significantly from the values shown above depending upon genetics, management, environmental conditions, and many other factors.

## Composter construction

Prior to constructing a composter, you must decide whether or not a roof over the composter is preferable. Current Missouri regulations do not require a roof or concrete floor in a swine composter, provided that sawdust is used as the carbon source in the composter. Properly mounded and landscaped sawdust effectively sheds water; leaching of fluids from the bottom of properly managed swine composters does not occur. The use of other carbon sources, such as straw, may require a roof to exclude rainwater and leaching from the pile. Limited experience has shown that use of less absorbent carbon sources like straw may result in leaching and less effective composting even though the composter is roofed.

The primary advantage of an unroofed composter is reduced cost. Advantages of roofed composters include: fewer weather effects on the composting process; worker protection during inclement weather; and a more aesthetically pleasing appearance to match other buildings in the production unit.

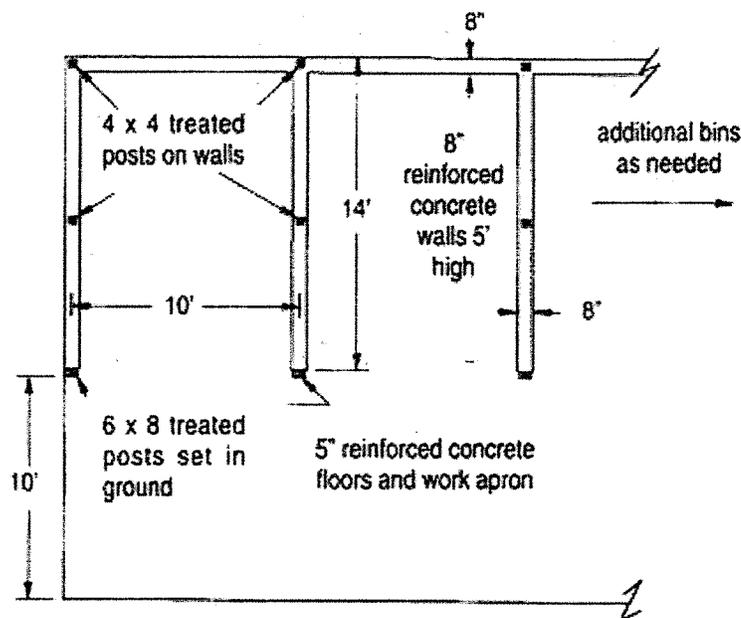

Field experience suggests that composting bins can be constructed using large round bales (5 to 6 feet in diameter) of low-quality hay. Bales are placed end-to-end to form walls for three-sided enclosures or bins. A layout three bales deep and two bales wide as shown in Figure 1 has worked well for swine composters.

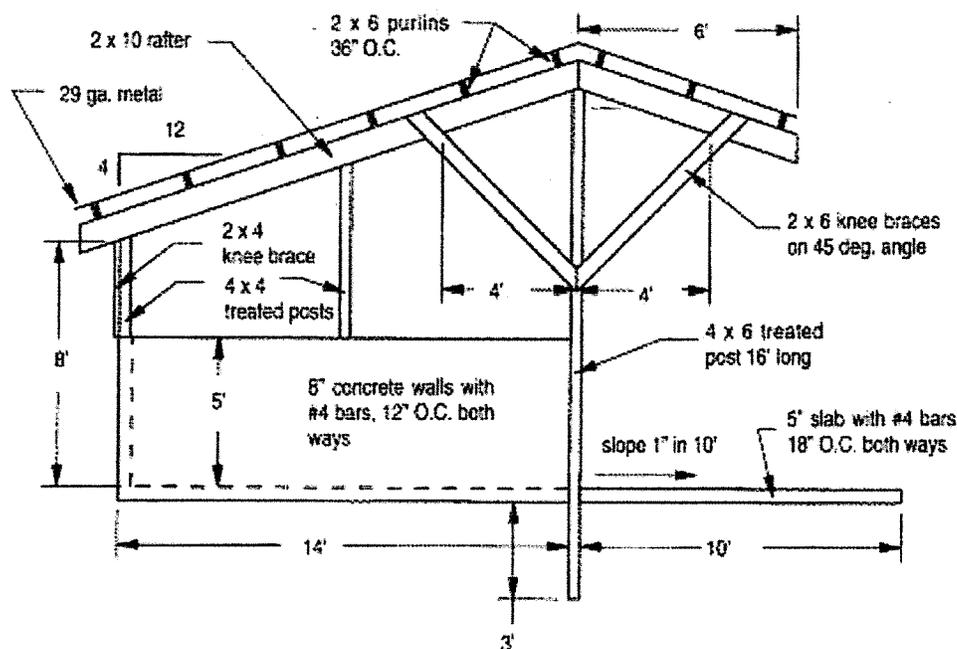

**Figure 1**  
Sample composter layout using hay bales.

Another alternative for the unroofed composter is to use concrete for the bin floor and walls. Although more costly, the concrete is a more durable construction material and is less subject to weathering and mechanical damage during cleaning operations. Also, less room is required than a similar composter using large round bales.

Figure 2 and Figure 3 are schematic drawings of one possible configuration for a roofed composter. This design uses concrete bin walls and floor and pole construction for end walls and roof. The roof overhang and concrete apron in front of the composter minimize rain blowing into the bins and provide a solid work area in front of the composting bins. Many other layouts and materials and could be used in constructing a composter.

**Figure 2**  
Schematic top view of a roofed composter with concrete bin walls.

**Figure 3**  
Schematic side view of a roofed composter with concrete bin walls

## Equipment requirements

Although composting is a simple process, certain equipment is necessary for good management of the operation.

Some type of front-end or skid steer loader is the most necessary piece of equipment in a composting

operation. The loader is needed to move carcasses from the production buildings to the composter. Although small carcasses can be deposited and covered in the composter by hand, larger carcasses cannot be adequately managed by hand. The loader provides a means to properly place larger carcasses in the compost pile and adequately cover the carcasses with sawdust or finished compost. The loader is also needed to move compost from primary to secondary bins and can be useful in receiving, storing and piling fresh sawdust from the sawmill. Finally, the loader is necessary for loading out finished compost for field spreading.

A probe-type thermometer will aid in monitoring the compost to determine if it is composting properly. Dial-type thermometers with a minimum 36-inch stainless steel stem allow measurement of temperatures in the interior of the composting pile. Temperatures should rise to the 130 to 160 degree F range for good composting.

A manure spreader should be available for field spreading finished compost. A conventional beater-type spreader for handling solid manure is also adequate for land applying finished compost.

A logbook is a useful record-keeping tool in a composting operation. Dates and weights of carcasses placed in the composter provide a record of death losses and a basis for improving death loss statistics. Temperature readings, amounts of fresh sawdust inventoried and used and dates when compost is transferred from primary to secondary bins are record-keeping items that can aid in managing the composting operation. Finally, dates and amounts of finished compost removed for land spreading also provide data for future management and planning.

## Composter operation and management

Although composters are simple and relatively easy to operate and manage, certain steps and procedures are necessary to ensure that the process proceeds properly. Table 3 outlines the steps that should provide acceptable finished compost in a swine operation.

**Table 3**

Steps in operating and managing a swine composter

1. Start a primary composting bin by placing enough sawdust in the bin so that there is at least one foot under and around the first carcasses placed in the bin. Carcasses placed directly on dirt or concrete floors or against bin walls will **not** compost properly.
2. Place carcasses in the primary bin as necessary. It is **very** important to use sufficient sawdust so each carcass is covered on all sides with a minimum of one foot of sawdust. Small pigs may be grouped or placed with less sawdust between carcasses, but a one foot covering between carcasses and the pile surface should always be maintained to minimize odors and rodent problems. **Never** leave hoofs legs ears or snouts sticking out of the sawdust pile. Most problems in swine composting arise when insufficient sawdust is used in covering carcasses. Use a pointed rod or dowel to measure the thickness of the sawdust cover. Large carcasses may need to be recovered after a day or two as the sawdust settles around the carcass. Keep the surface of the pile shaped so that it will shed rainwater out the front of the bin if the composter is not roofed. Do not allow pockets to form in the bin corners or elsewhere that will pool water. Carcasses placed in warm sawdust begin composting more quickly. This can be accomplished by overfilling sawdust over the previous carcasses. This allows the sawdust to heat up so that the next carcass is then buried in this pre-warmed sawdust. The loader bucket is used to "wallow-out" a cavity in the pre-warmed sawdust and the fresh carcass is placed in this cavity. If finished compost is available, it should be used to cover the carcass to provide additional heat and bacteria to start the composting process. Fresh sawdust should then be used to provide the final cover thickness needed so a new cavity can be

provided for the next carcass.

3. Monitor temperature of the composting pile with a long-stem dial-type thermometer. When composting is proceeding properly temperatures will reach 130 to 160 degrees Fahrenheit. If a thermometer is not available you can obtain a rough indication of temperature by inserting a steel rod in the compost pile and feeling how hot it is when you pull it out. Primary bins started during cold weather may not begin composting immediately. However if carcasses are buried with the proper amounts of sawdust composting should begin on its own as temperatures warm up in the spring. There is usually enough heat in active (as opposed to newly started) compost piles to continue composting through cold weather regardless of ambient temperature. If sawdust is used as recommended the insulation effect is sufficient to minimize the effects of ambient temperature.
4. After the last carcasses placed in the primary bin have composted three months or longer move the contents to a secondary bin. This step provides mixing and re-aeration of the material so that the compost will "finish off" properly.
5. After the pile has composted another three months in the secondary bin it should appear as a dark granular nearly black humus-like material with very little odor. Some resistant parts such as teeth may still be identifiable but should be soft and easily crumbled.
6. Use the finished compost as noted above for a "starter" material on the new carcasses being composted in the primary bin. This provides heat and bacteria to enhance starting of the composting process. Experience has shown that up to 50 percent of the sawdust requirement for composting can be filled using "recycled" finished compost. However plan to use fresh sawdust in the amounts noted for starting up a composting operation until sufficient finished compost becomes available. Haul and spread finished compost as needed using a conventional manure spreader. Apply finished compost at agronomic rates for the crop being grown. Obtain a laboratory analysis of the compost for nitrogen (N) phosphate ( $P_2O_5$ ) and potash ( $K_2O$ ) for precise fertilizer content. The following table gives average values of fertilizer nutrients from several samples of finished swine compost.

	Fertilizer nutrients, pounds per ton wet basis				
	Dry matter	Total nitrogen	Ammonia nitrogen	$P_2O_5$	$K_2O$
Finished compost	1,000	20	4	2	6
Fresh sawdust	800	1	0	0.2	0.4

7. Keep fresh sawdust as dry as possible because dry sawdust works better in the composting process. Fresh sawdust in a pile will shed water reasonably well if the pile is mounded, with no pockets or depressions.
8. Keep the area around the composter mowed and free of tall weeds and brush. Watch for any leaching that might occur. Using more sawdust in the bottom of the bins can help eliminate leaching.

## Frequently asked questions

Certain questions regarding composting frequently arise. Some of these questions and answers are as follows.

### Doesn't a dead animal compost stink, and attract rodents and dogs?

If carcasses are properly covered with sawdust (one foot recommended), odors are sufficiently suppressed

or absorbed so that they are not a problem in most cases. When operated properly, composters do not add to, or increase odor levels around a production facility. Using too little sawdust is the single greatest factor in excess odor and associated rodent problems. It is important to prevent a rodent problem when starting up a composter, because once rodents learn the composter is a source of carcasses, they can be difficult to stop.

## **What happens in the wintertime when temperatures are cold?**

In general, the warmer the ambient temperature, the better the composting process works. However, an active compost pile contains considerable heat which, with the insulating effect of the sawdust, minimizes effects of ambient temperatures. Interior pile temperatures of 130 to 160 degrees Fahrenheit are typical in properly operating composters when ambient temperatures are as low as zero degrees Fahrenheit. Cold or frozen carcasses placed in cold (fresh) sawdust will not begin composting during cold weather. However, carcasses placed under these conditions will begin to compost as ambient temperatures warm up in the spring.

Carcasses placed in an active compost pile during cold weather should begin composting as heat is absorbed from the composting mass. Covering the carcass with warm or hot finished compost from an active secondary bin will further enhance composting fresh carcasses in cold ambient temperatures.

## **How large a carcass can be put in the composter?**

Mature sows and boars (300 to 600 pounds) have been successfully composted. Longer composting times are required for larger carcasses. However, six months of active (temperatures 130 degrees Fahrenheit or above) composting time should be sufficient for most swine carcasses. These carcasses are composted whole (no cleaving or cutting up of the carcass).

## **Will Missouri DNR approve this type of composter in a waste management plan?**

The primary concern of the regulatory agency is to prevent contamination of ground or surface water. Hence, any contamination problem arising from a composter (or any other part of the production facility) would have to be corrected. Contamination potential from composters located and operated as indicated in this publication is quite low. Under current policy, Missouri DNR will approve unroofed swine composters if sawdust is used as the carbon source and the composter is properly managed. Use of other carbon sources such as straw will likely require a roofed structure to minimize water absorption and leaching.

## **What should the finished compost look like?**

Properly finished compost should appear as a dark, nearly black granular material resembling humus or potting soil. It may have a slight musty odor. Some resistant bones (skull parts, teeth) will be visible, but they should be soft and easily crumbled by hand.

## **What about diseases, flies and pathogens?**

Temperatures above 140 degrees Fahrenheit normally occur at some time in the composting pile. This is sufficient to destroy pathogens and prevent fly incubation. Good coverage of the composting pile with sawdust eliminates the fly breeding and incubation environment. No disease outbreaks have been associated with composting to date. Spreading finished compost in fields or pastures helps assure that disease organisms do not find their way back to the production area.

## **I do not have sawdust available. Can I use something else for a carbon source?**

Any granular organic material with a high carbon content should be a candidate as an ingredient in composting. Most successful swine composting thus far has been accomplished using sawdust as the carbon source. More research and experience is needed to evaluate other carbon sources such as straw, hay, rice hulls and cornstalks. A long, fibrous material such as straw or cornstalks would likely work much better for composting if it were ground to reduce the particle size similar to that of sawdust. This would allow the material to settle around the carcass and provide the contact needed for good bacterial activity.

## **Can finished compost be used as a partial or full substitute for fresh sawdust in the primary bin?**

Experience to date indicates that up to 50 percent of the fresh sawdust requirement may be fulfilled using finished compost. It is unlikely that long-term viability of the process could be maintained if no fresh sawdust were used, as the source of carbon would eventually be exhausted. Advantages of recycling finished compost include: less fresh sawdust required, active bacteria and heat contained in finished compost and less finished compost to haul for land spreading.

## **What happens if the composting process fails, or leaching occurs?**

Excessive moisture in the composting pile is the most frequent cause of leaching and failure of carcasses to compost properly. The use of adequate amounts of dry or nearly dry sawdust is the best way to eliminate excessive moisture. Any surface water should be diverted around and away from the composter. If a composting pile becomes too wet, it can usually be recovered by moving it to another bin, and mixing in additional dry ingredients during the moving process.

## **What should I do with finished compost?**

Finished dead animal compost, which is not recycled in primary bins, should be spread following agronomic practices used for spreading manure. Compost should be spread at agronomic rates so that applied nutrients do not exceed the uptake capabilities of the crop being grown. Conventional "beater-type" manure spreaders are ideal for handling and spreading compost. Care should be taken not to spread compost in or near sensitive areas such as streams, lakes, ponds, sinkholes, public rights-of-way and road ditches.

## **Can I compost in just one step, rather than moving the material from primary to secondary bins?**

Moving compost from primary to secondary bins provides mixing, adds oxygen, and allows the compost to "finish off" with a high degree of breakdown. The success of the primary/secondary approach has been demonstrated in many other areas of composting, as well as swine. Some producers have reported acceptable results with single-step composting, but total composting time may be longer than that required for primary/secondary composting. Also, bin volume requirements are not reduced by single-step composting.

## **What about using 'green' or wet sawdust?**

Generally, the dryer the sawdust, the better, since dryer sawdust can absorb more water. However, producers have reported success when using green sawdust for some or all of the fresh sawdust

requirement. Sawdust containing excessive moisture may freeze into chunks in the winter, making it difficult to handle and place around carcasses.

## Will composting work for larger carcasses such as cattle?

Experience with large swine carcasses (600 to 700 pounds) suggest that cattle carcasses could be composted in this manner if properly managed. Large cattle carcasses will be more difficult to handle and properly place in a composter. Required composting time is proportional to carcass weight, hence large cattle carcasses may require up to a year of active composting time. Also, more movement, mixing, and aeration of the composting pile may be necessary. It is likely that more sawdust per pound of carcass will be required with cattle carcasses due to the amount required for adequate coverage of the legs and head. No experience has been gained to date to provide information similar to that in Table 1 for cattle.

## Sizing a composter

The examples on the following pages, used with the Swine composter worksheet, illustrate a method of sizing a swine composter, and estimating annual sawdust requirements.

### Example 1

Size a composter for a 200-sow, farrow-to-finish operation. Use data in Table 2 to estimate death loss. Estimate annual sawdust requirements. There are 200 mature animals (sows, boars, gilts), 700 nursery pigs, and 1,640 finishing pigs in the operation.

## Swine composter worksheet

### 1. Calculate weight of carcasses composted. Use data from actual experience, or use Table 2.

#### Sow herd

Number of sows x average weight x percent (Table 2) ÷ 100 = pounds loss per year

$$\underline{200} \times \underline{375} \text{ pounds} \times \underline{7} \text{ percent} \div 100 = \underline{5,250} \text{ pounds per year}$$

#### Nursery

Number of pig spaces x average weight x percent (Table 2) ÷ 100 = pounds loss per year

$$\underline{700} \times \underline{32} \text{ pounds} \times \underline{24} \text{ percent} \div 100 = \underline{5,376} \text{ pounds per year}$$

#### Finishing

Number of pig spaces x average weight x percent (Table 2) ÷ 100 = pounds loss per year

$$\underline{1,640} \times \underline{150} \text{ pounds} \times \underline{11} \text{ percent} \div 100 = \underline{27,060} \text{ pounds per year}$$

$$\text{Total} = \underline{37,686} \text{ pounds per year}$$

$$\text{pounds composted daily} = (\text{pounds per year}) \div 365 = \underline{37,686} \text{ pounds per year} \div 365 = \underline{103} \text{ pounds per day}$$

**2. Calculate primary and secondary bin volume.**

pounds composted daily (Step 1) x 20 = primary bin volume, cubic feet

103 pounds per day x 20 = 2,060 cubic feet primary bin volume

pounds composted daily (Step 1) x 20 = secondary bin volume, cubic feet

103 pounds per day x 20 = 2,060 cubic feet secondary bin volume

**3. Calculate bin area (use volumes from Step 2).**

bin volume, cubic feet ÷ depth (usually 5 to 6 feet) = bin area, square feet

2,060 cubic feet ÷ 6 feet = 343 square feet primary bin

bin volume, cubic feet ÷ depth (usually 5 to 6 feet) = bin area, square feet

2,060 cubic feet ÷ 6 feet = 343 square feet secondary bin

**4. Calculate number of bins (at least 3 bins required).**

primary bin area (Step 3) ÷ (100 to 200 square feet per bin) = number of bins

343 square feet ÷ 110 square feet per bin = 3.1 primary bins

secondary bin area (Step 3) ÷ (100 to 200 square feet per bin) = number of bins

343 square feet ÷ 110 square feet per bin = 3.1 secondary bins

**5. Calculate bin dimensions.**

bin depth = composting depth (usually 5 to 6 feet) = 6 feet depth

bin width = loader bucket width + 2 feet or wider = 10 feet width

bin length = bin area (Step 3) ÷ bin width = 110 square feet ÷ 10 feet = 11 feet length

**6. Calculate annual sawdust requirements.**

pounds composted per year (Step 1) x 0.0037 = cu yd sawdust per year

37,686 pounds per year x 0.0037 = 139 cu yd sawdust-per year

**Example 2**

Size a composter for a 2,400-sow farrowing operation. Death loss data for the operation is as follows:

Four 375 pound sows per week

200 pound small pigs and afterbirth per day

Calculate annual and daily carcass weight and enter directly in Step 1 of the worksheet.

375 pound sow x 4 sows per week x 52 weeks per year = 78,000 pounds per year

200 pound pigs and afterbirth per day x 365 days per year = 73,000 pounds per year

Total = 151,000 pounds per year = 414 pounds per day

## Swine composter worksheet

### 1. Calculate weight of carcasses composted. Use data from actual experience, or use Table 2.

#### Sow herd

Number of sows x average weight x percent (Table 2) ÷ 100 = pounds loss per year

\_\_\_ x \_\_\_ pounds x \_\_\_ percent ÷ 100 = \_\_\_ pounds per year

#### Nursery

Number of pig spaces x average weight x percent (Table 2) ÷ 100 = pounds loss per year

\_\_\_ x \_\_\_ pounds x \_\_\_ percent ÷ 100 = \_\_\_ pounds per year

#### Finishing

Number of pig spaces x average weight x percent (Table 2) ÷ 100 = pounds loss per year

\_\_\_ x \_\_\_ pounds x \_\_\_ percent ÷ 100 = \_\_\_ pounds per year

Total = 151,000 pounds per year

pounds composted daily = (pounds per year) ÷ 365 = 151,000 pounds per year ÷ 365 = 414 pounds per day

### 2. Calculate primary and secondary bin volume.

pounds composted daily (Step 1) x 20 = primary bin volume, cubic feet

414 pounds per day x 20 = 8,280 cubic feet primary bin volume

pounds composted daily (Step 1) x 20 = secondary bin volume, cubic feet

414 pounds per day x 20 = 8,280 cubic feet secondary bin volume

### 3. Calculate bin area (use volumes from Step 2).

bin volume, cubic feet ÷ depth (usually 5 to 6 feet) = bin area, square feet

8,280 cubic feet ÷ 6 feet = 1,380 square feet primary bin

bin volume, cubic feet ÷ depth (usually 5 to 6 feet) = bin area, square feet

8,280 cubic feet ÷ 6 feet = 1,380 square feet secondary bin

**4. Calculate number of bins (at least 3 bins required).**

primary bin area (Step 3) ÷ (100 to 200 square feet per bin) = Number of bins

1,380 square feet ÷ 170 square feet per bin = 8.1 primary bins

secondary bin area (Step 3) ÷ (100 to 200 square feet per bin) = Number of bins

1,380 square feet ÷ 170 square feet per bin = 8.1 secondary bins

**5. Calculate bin dimensions.**

bin depth = composting depth (usually 5 to 6 feet) = 6 feet depth

bin width = loader bucket width + 2 feet or wider = 12 feet width

bin length = bin area (Step 3) ÷ bin width = 170 square feet ÷ 12 feet = 14 feet length

**6. Calculate annual sawdust requirements.**

pounds composted per year (Step 1) x 0.0037 = cu yd sawdust per year

151,110 pounds per year x 0.0037 = 559 cu yd sawdust per year

**Example 3**

Size a composter for an off-site nursery with a capacity of 8,400 pigs. Average weight in the nursery is 27 pounds. Use data in Table 2 to estimate death loss.

**Swine composter worksheet****1. Calculate weight of carcasses composted. Use data from actual experience, or use Table 2.****Sow herd**

Number of sows x average weight x percent (Table 2) ÷ 100 = pounds loss per year

\_\_\_ x \_\_\_ pounds x \_\_\_ percent ÷ 100 = \_\_\_ pounds per year

**Nursery**

Number of pig spaces x average weight x percent (Table 2) ÷ 100 = pounds loss per year

8,400 x 27 pounds x 24 percent ÷ 100 = 54,432 pounds per year

**Finishing**

Number of pig spaces x average weight x percent (Table 2) ÷ 100 = pounds loss per year

\_\_\_ x \_\_\_ pounds x \_\_\_ percent ÷ 100 = \_\_\_ pounds per year

Total = 54,432 pounds per year

pounds composted daily = (pounds per year) ÷ 365 = 54,432 pounds per year ÷ 365 = 149 pounds per day

## 2. Calculate primary and secondary bin volume.

pounds composted daily (Step 1) x 20 = primary bin volume, cubic feet

149 pounds per day x 20 = 2,980 cubic feet primary bin volume

pounds composted daily (Step 1) x 20 = secondary bin volume, cubic feet

149 pounds per day x 20 = 2,980 cubic feet secondary bin volume

## 3. Calculate bin area (use volumes from Step 2).

bin volume, cubic feet ÷ depth (usually 5 to 6 feet) = bin area, square feet

2,980 cubic feet ÷ 6 feet = 497 square feet primary bin

bin volume, cubic feet ÷ depth (usually 5 to 6 feet) = bin area, square feet

2,980 cubic feet ÷ 6 feet = 497 square feet secondary bin

## 4. Calculate number of bins (at least 3 bins required).

primary bin area (Step 3) ÷ (100 to 200 square feet per bin) = Number of bins

497 square feet ÷ 160 square feet per bin = 3.1 primary bins

secondary bin area (Step 3) ÷ (100 to 200 square feet per bin) = Number of bins

497 square feet ÷ 160 square feet per bin = 3.1 secondary bins

## 5. Calculate bin dimensions.

bin depth = composting depth (usually 5 to 6 feet) = 16 feet depth

bin width = loader bucket width + 2 feet or wider = 10 feet width

bin length = bin area (Step 3) ÷ bin width = 160 square feet ÷ 10 feet = 16 feet length

## 6. Calculate annual sawdust requirements.

pounds composted per year (Step 1) x 0.0037 = cu yd sawdust per year

54,432 pounds per year x 0.0037 = 201 cu yd sawdust per year

# Swine composter worksheet

## 1. Calculate weight of carcasses composted. Use data from actual experience, or use Table 2.

Sow herd

Number of sows x average weight x percent (Table 2) ÷ 100 = pounds loss per year

\_\_\_ x \_\_\_ pounds x \_\_\_ percent ÷ 100 = \_\_\_ pounds per year

**Nursery**

Number of pig spaces x average weight x percent (Table 2) ÷ 100 = pounds loss per year

\_\_\_ x \_\_\_ pounds x \_\_\_ percent ÷ 100 = \_\_\_ pounds per year

**Finishing**

Number of pig spaces x average weight x percent (Table 2) ÷ 100 = pounds loss per year

\_\_\_ x \_\_\_ pounds x \_\_\_ percent ÷ 100 = \_\_\_ pounds per year

Total = \_\_\_ pounds per year

pounds composted daily = (pounds per year) ÷ 365 = \_\_\_ pounds per year ÷ 365 = \_\_\_ pounds per day

**2. Calculate primary and secondary bin volume.**

pounds composted daily (Step 1) x 20 = primary bin volume, cubic feet

\_\_\_ pounds per day x 20 = \_\_\_ cubic feet primary bin volume

pounds composted daily (Step 1) x 20 = secondary bin volume, cubic feet

\_\_\_ pounds per day x 20 = \_\_\_ cubic feet secondary bin volume

**3. Calculate bin area (use volumes from Step 2).**

bin volume, cubic feet ÷ depth (usually 5 to 6 feet) = bin area, square feet

\_\_\_ cubic feet ÷ \_\_\_ feet = \_\_\_ square feet primary bin

bin volume, cubic feet ÷ depth (usually 5 to 6 feet) = bin area, square feet

\_\_\_ cubic feet ÷ \_\_\_ feet = \_\_\_ square feet secondary bin

**4. Calculate number of bins (at least 3 bins required).**

primary bin area (Step 3) ÷ (100 to 200 square feet per bin) = number of bins

\_\_\_ square feet ÷ \_\_\_ square feet per bin = \_\_\_ primary bins

secondary bin area (Step 3) ÷ (100 to 200 square feet per bin) = number of bins

\_\_\_ square feet ÷ \_\_\_ square feet per bin = \_\_\_ secondary bins

**5. Calculate bin dimensions.**

bin depth = composting depth (usually 5 to 6 feet) = \_\_\_ feet depth

bin width = loader bucket width + 2 feet or wider = \_\_\_ feet width

bin length = bin area (Step 3) ÷ bin width = \_\_\_ square feet ÷ \_\_\_ feet = \_\_\_ feet length

## 6. Calculate annual sawdust requirements.

pounds composted per year (Step 1) x 0.0037 = cu yd sawdust per year

\_\_\_ pounds per year x 0.0037 = \_\_\_ cu yd sawdust per year

The author expresses his deep appreciation to Mel Gerber, Versailles, Mo. for his initiative and extensive cooperation and efforts in applied field research on swine composting. Many of the design and management recommendations for composting are derived from Mel's early experiences and his desire to share those experiences for the benefit of the swine industry.
