Introduction

In Missouri, the Public Drinking Water Branch of the Missouri Department of Natural Resources has the responsibility of implementing the Safe Drinking Water Act and ensuring that the state's 2,731 public water systems provide safe drinking water. To do this, the Department sets limits and monitors for 91 different chemical and microbiological contaminants that could be found in public water supplies. This report provides information on how well Missouri's public water systems are doing in regard to meeting these standards.

This report is the 22nd Annual Compliance Report produced by the Department. It contains compliance statistics for Missouri's public water systems for calendar year 2017. The report shows that 96.9 percent of Missouri's population is served by a community public water system that met all health based standards in 2017.

The Department prepares this report not only to comply with statutory obligations mandated by the federal Safe Drinking Water Act, but also to provide an understanding of the importance of safe and abundant drinking water to the public. This report will be provided to the U.S. Environmental Protection Agency for inclusion in a national report that summarizes the performance of the nation's public drinking water systems.

What is a Public Water System?

A public water system is defined as a system that provides water through piping or other constructed conveyances for human consumption to at least 15 service connections, or serves an average of at least 25 people for at least 60 days each year. These are the systems that are the focus of this report.

There are three types of public water systems:

1. Community systems include towns, water districts, subdivisions, mobile home parks and residential facilities such as nursing homes or prisons.
2. Nontransient noncommunity systems regularly serve the same 25 people at least six months per year; schools and factories are good examples.
3. Transient noncommunity systems serve at least 25 people per day, at least 60 days of the year. Examples of transient noncommunity systems would be restaurants, resorts and campgrounds. These smaller systems are typically in rural areas where it is not feasible to hook up to a city or water district.

Requirements for construction, operation, monitoring, etc., vary among systems based on their type, population and source of water. Water testing at systems that are not public water systems (for example, homes served by private wells) is facilitated by local and county health agencies and the Missouri Department of Health and Senior Services, rather than the Missouri Department of Natural Resources.

The Missouri Public Water System Universe

In 2017, there were 2731 active public water systems in Missouri. Of this total, 1424 were community, 218 were nontransient noncommunity, and 1,089 were transient noncommunity systems.

The community water systems in Missouri served more than 5 million citizens in 2017. By far the largest source of drinking water for Missourians is surface water from the Missouri River. The abundant supply of water in the Missouri River and its proximity to the state's major

population centers make the river a valuable resource to the communities that draw from it. Groundwater is the next most common source of drinking water for community water supplies. Generally, in southern Missouri, high-quality groundwater is easy to obtain and typically requires very little treatment to be used for drinking water. Approximately 37 percent of Missourians are served by a public system utilizing groundwater.

The remaining Missourians served by public water systems receive their water from other surface water sources. Particularly prevalent in the Northern part of Missouri, these include rivers and reservoirs that provide raw water to the water systems.

Analysis of Compliance

Missouri requires testing for 91 different regulated chemicals and microbiological contaminants on a regular schedule. However, many public water systems perform testing beyond what is required by the state. The Summary of Violations table in this report counts individual violations by contaminant type. It is important to note that some systems may have multiple violations for the same contaminants, depending on the monitoring schedule for that particular contaminant.

Appendices A through C list specific systems by county that have had violations of different drinking water rules. These rules include the Revised Total Coliform Rule, Radionuclide Rule, Stage 2 Disinfectants and Disinfection Byproduct Rule, and the Surface Water Treatment Rule.

Maximum Contaminant Level (MCL) and treatment technique violations represent the most significant impact on public health. In 2017, 96.9 percent of public water supply customers had water that met all MCL and treatment technique requirements. EPA and the states have worked together to develop an additional compliance measure called “person-months,” which represents the population served by community water systems providing water that meets health-based standards on a monthly basis. This measure is intended to take into account situations where violations are of short duration. Missouri achieved 96.51 percent compliance with this measure in 2017. The national target for federal fiscal year 2017 was 95 percent.

Many of the MCL and treatment technique violations reference chronic contaminants, which are based on continuous long-term exposure to cause health effects. Other MCLs are based on acute, or short-term health effects. In 2017, 26 public water systems, equal to 0.95 percent had acute violations for E. coli. While these acute violations can be serious, they are rare.

How to Find More Information on Your Water System

Consumer Confidence Reports provide detailed information for individual community water systems. Community water systems must distribute the report annually to water customers detailing specific information about their water system. This includes information about the sources and the levels of contaminants in the drinking water. Usually, these contaminants pose no health threat or are below the MCL and are not violations. The report must list violations of state and federal requirements for the calendar year. The Department prepares a draft Consumer Confidence Report for water systems to review and use and posts this on its server at dnr.mo.gov/ccr/index.html along with additional information about the reports. The Department also hosts the final version of each water system's report and provides a unique URL web address for customers to access the report for each system. As a result of these efforts, Consumer Confidence Report compliance rates increased over the previous years. In 2017, 99.1 percent of Missouri's community water systems distributed their Consumer Confidence Reports properly. Anyone can request a copy of a Consumer Confidence Report from their public water system or by calling the Department's Public Drinking Water Branch at 800-361-4827 or 573-751-5331.

In addition to Consumer Confidence Reports, the Department also maintains the Drinking Water Watch website, located at dnr.mo.gov/DWW/. From this website, additional information on all of Missouri's public drinking water systems can be obtained, including information on inventories, sample results, compliance activities, and water quality.

For More Information

Information about Missouri's public water systems can be obtained by writing to the Missouri Department of Natural Resources, Water Protection Program, Public Drinking Water Branch, P.O. Box 176, Jefferson City, MO 65102-0176 or calling 800-361-4827 or 573-751-5331.

Information is also available on the Department's website at dnr.mo.gov/env/wpp/dw-index.html.

Summary of Violations Table

The following definitions apply to the Summary of Violations table.

Filtered Systems: Water systems that have installed filtration treatment [10 CSR 60-4.050].

Inorganic Contaminants: Non-carbon-based compounds such as metals, fluoride and nitrates. These contaminants are naturally-occurring in some water, but can get into water through human activities [10 CSR 60-4.030]

Lead and Copper Rule: Lead and copper corrosion poses various health risks when ingested at any level, and can enter drinking water from household pipes and plumbing fixtures [10 CSR 60, Chapter 15]. Violations are reported for: failure to monitor; failure to install optimal corrosion control treatment or a source water treatment system that would reduce lead and copper levels in water at the tap; failure to replace lead service lines on the schedule required by the regulation; and failure to provide required public education about reducing or avoiding lead intake from drinking water.

Organic Contaminants: Carbon-based compounds, such as industrial solvents and pesticides. These contaminants generally get into water through runoff from cropland or discharge from factories [10CSR 60-4.040 and 4.100].

Radionuclides: Radioactive particles can occur naturally in water or result from human activity. Safe drinking water regulations set MCLs on five types of radionuclides: radium-226, radium-228, uranium, gross alpha and beta particle/photon radioactivity [10 CSR 60-4.060].

Surface Water Treatment Rule: This includes a series of rules promulgated from 1989-2009 that establish criteria under which water systems supplied by surface water sources, or groundwater sources under the direct influence of surface water, must filter and disinfect their water (Surface Water Treatment Rule, Interim Enhanced Surface Water Treatment Rule, Long Term 1 Enhanced Surface Water Treatment Rule, Long Term 2 Enhanced Surface Water Treatment Rule) [10 CSR 60-4.050 and 60-4.052].

Violations of the surface water treatment rules are reported for the following categories:

- **Monitoring, routine/repeat (for filtered systems):** Failure to carry out required tests or to report the results of those tests. A major monitoring violation for the surface water treatment rule occurs when at least 90 percent of the required samples are not taken or results are not reported during the compliance period.
- **Treatment techniques (for filtered systems):** Failure to properly treat the water.
- **Revised Total Coliform Rule:** This rule establishes regulations for microbiological contaminants in drinking water. These contaminants have the potential to cause acute health problems. If no samples are collected during the one-month compliance period, a major monitoring violation occurs. Violations of this rule are reported for the following:
 1. **Acute MCL violation:** A violation where the system found E. coli, potentially harmful bacteria, in its water.
 2. **Treatment Technique violation:** If a water system has a positive bacteriological sample, they may be required to complete a Level 1 or Level 2 Assessment to determine the cause of the result. If they do not complete the assessment, or do not respond to or correct the findings in the assessment, a treatment technique violation may be assigned.
 3. **Major routine and follow-up monitoring:** A violation where a system did not perform any monitoring.

Maximum Contaminant Level: The highest amount of a contaminant allowed in drinking water. MCLs ensure drinking water does not pose a health risk and are defined in milligrams per liter (parts per million) unless otherwise specified.

Monitoring: The Department specifies which water testing methods the water systems must use and sets schedules for the frequency of testing. A water system that does not follow the Department's schedule or

methodology is in violation [10 CSR 60-4.010]. States must report monitoring violations that are significant as determined by the EPA Administrator, in consultation with the Department. For purposes of this report, significant monitoring violations are major violations and they occur when no samples are taken or no results are reported during a compliance period.

Ground Water Rule: Applies to public water systems that serve groundwater. It ensures monitoring of groundwater sources for E. coli contamination, and relies on four strategies to address this risk: periodic sanitary surveys, triggered source water monitoring in the case of a positive sample, corrective action for a system found to have a significant deficiency or source water E. coli contamination, and compliance monitoring to ensure the treatment technology is reliable.

Treatment Techniques: A water disinfection process that EPA requires instead of a MCL for contaminants that laboratories cannot adequately measure. Failure to meet other operational and system requirements under the Surface Water Treatment and the Lead and Copper Rules have also been included in this category of violation for purposes of this report.

Violation: A failure to meet any state or federal drinking water regulation.

Organic Contaminants: Jan. 1, 2017 - Dec. 31, 2017

	MCL		Treatment Technique		Significant		
	MCL (mg/L)	No. of Violations	No. of Systems with Violations	No. of Violations	No. of Systems with Violations	No. of Violations	No. of Systems with Violations

Appendix A - Health Based Compliance

II. Revised Total Coliform Rule - Level 1 and Level 2 Assessment

Since the transition to the Revised Total Coliform Rule April 1, 2016, the following systems have exceeded the coliform treatment technique trigger - triggering an assessment on more than one occasion in 2016. These assessments are triggered for the following reasons: systems collecting forty (40) or more samples per month exceeding 5.0% total-coliform positive samples for the month, systems collecting fewer than forty (40) samples per month having two (2) or more coliform-positive samples for the month, failing to collect every required repeat sample after any coliform-positive sample, or incurring an E coli MCL violation.
